1 Introduction

This manual describes the P80630-SDN series of stepper drives. The drives are operated in systems together with other Kollmorgen devices. Please observe the entire system documentation, consisting of:

- Instruction manual for the stepper amplifier
- Technical description of the P8000 series of drives

More background information can be found in the Support section of the Kollmorgen website at www.kollmorgen.com/en-us/developer-network/.
2 Additional System Components and System Diagram

In addition to the drive, the components that comprise a motor control system include:

- Indexer or pulse generator
- Single power supply (24-75 V\text{DC})
- Stepper Motor

Installation guidelines for these components are described in You Should Read This.

2.1 System Diagram

The following diagram shows an installation of the drive in a typical system.

![System Diagram]

**NOTE**
Your installation may vary from this configuration. Always use shielded, twisted pairs for STEP and DIR inputs. Route away from motor leads.
3 You Should Read This

3.1 Safety Symbols

<td>Warning of a danger (general). The type of danger is specified by the text next to the symbol.</td>
</tr>
</tbody>
</table>

3.2 Safety

This section describes the safety requirements for the P8000 stepper drive.

3.3 Your responsibility

Only qualified personnel are permitted to transport, assemble, commission, and maintain this equipment. Properly qualified personnel are persons who are familiar with the transport, assembly, installation, commissioning and operation of motors, and who have the appropriate qualifications for their jobs.

Read all available documentation before assembling and using. Incorrect handling of products in this manual can result in injury and damage to persons and machinery. Strictly adhere to the technical information regarding installation requirements. In no event will Kollmorgen be responsible or liable for indirect or consequential damage resulting from the misuse of this product. Read this manual completely to effectively and safely operate the P8000 unit.

**WARNING**
- The circuits in the P8000 drive are a potential source of severe electrical shock. Follow the safety guidelines to avoid shock.
- Miswiring of the P8000 drive may result in damage to the unit and void the warranty. Improper grounding of the drive may cause serious injury to the operator.

---

Kollmorgen | kdn.kollmorgen.com | August 2023
3.4 Safety Guidelines

It is the machine builder's responsibility to ensure that the complete machine complies with the Machine Directive (EN60204). The following requirements relate directly to the stepper controller:

- Do not operate the drive without the motor case tied to earth ground. Keep all covers and cabinet doors shut during operation.
- Do not make any connections to the internal circuitry. The input and output signals are the only safe connection points.
- Never plug or unplug connectors with power applied. During operation, the product has electrically charged components and hot surfaces. Control and power cables can carry a high voltage, even when the motor is not rotating.
- Never disconnect or connect the product while the power source is energized.
- Be careful of the motor terminals (CN1 Port) when disconnected from the motor. With the motor disconnected and power applied to the drive, these terminals have high voltage present, even with the motor disconnected.
- After removing the power source from the equipment, wait at least 3 minutes before touching or disconnecting sections of the equipment that normally carry electrical charges (e.g., capacitors, contacts, screw connections). To be safe, measure the electrical contact points with a meter before touching the equipment.
- Do not use the Enable Input as a safety shutdown. Always remove power to the drive for a safety shutdown.
- If the drive indicates a fault condition, find the cause of the fault and fix it prior to resetting the fault or power cycling the drive.
3.5 Unpacking and Inspecting
This section describes the unpacking and inspection procedures for the P8000 stepper drive.

3.5.1 Unpacking Procedure
1. Remove the P8000 and any other contents from the shipping container.
2. Remove all packing material from the shipping container. Be aware that some connector kits and other equipment pieces may be quite small and can be accidentally discarded.
3. A label located on the side of the unit identifies the unit by both the model number and serial number.

3.5.2 Inspection Procedure
Inspect the unit for any physical damage that may have been sustained during shipment. If damage is detected, either concealed or obvious, notify the carrier immediately.
3.6 Selecting Additional System Components

3.6.1 Indexer Selection
The P80630 drive requires step and direction or CW/CCW step inputs. Select an indexer that provides 5-24 nominal VDC logic signals. A compatible indexer will provide the capability to drive the input circuits described in Input Connections. For most applications that operate at speeds above 300 RPM, an indexer that can ramp the step frequency is required.

3.6.2 Motor Selection
The P8000 is designed for use with most Kollmorgen stepper motors or most other 2 phase stepper motors. When using Kollmorgen motors, the drive's output waveform is optimized to maximize smoothness in order to achieve the best system performance. When using non-Kollmorgen motors, the motor winding current rating must be compatible with the output current of the drive package. Refer to the Torque/Speed Curves in the Kollmorgen Stepper Solutions Catalog for best motor selections or contact your local Kollmorgen distributor for sizing and motor compatibility assistance.

3.6.3 Power Supply Selection
A single power supply is required to operate the P80630 unit. The power supply voltage can vary between 24 VDC and 75 VDC maximum at a maximum current of 5.5 Amps. A regulated power supply is recommended. An unregulated power supply may be used as long as the voltage stays between the limits; keep the ripple voltage to 10% or less for best results. The P8000 drive has a short time delay for power-on reset before the motor is energized.

⚠️ CAUTION ⚠️
Power supply voltage in excess of 75 VDC will damage the P80630.

The choice of power supply voltage depends on the required speed performance of the motor and the motor's inductance. The motor's holding torque and low-speed torque is unaffected by power supply voltage. Supply voltage affects motor power (speed times torque) output and power output increases proportionally with supply voltage. Motor eddy current heating goes up with the square of the supply voltage so motor heating outraces the motor's mechanical power output with increasing supply voltage. The maximum practical power supply voltage is capped by the motor's rated case temperature.

⚠️ CAUTION ⚠️
Avoid ON/OFF switching of the DC connection to the drive.

Hard-wire the drive to the power supply and switch the power supply AC input ON/OFF instead. Switching the DC to the drive results in very high inrush currents. This could potentially damage the P8000 drive or the ON/OFF switch.
3.7 Wiring The P8000

3.7.1 Wiring Is Application Specific
Wiring sizes, wiring practices and grounding/shielding techniques described in this manual represent common wiring practices and should prove satisfactory in the majority of applications.

⚠️ CAUTION ⚠️
Non-standard applications, local electrical codes, special operating conditions, and system configuration wiring needs take precedence over the information included here. Therefore, you may need to wire the drive differently than what is described here.

3.7.2 Electrical Noise Reduction
Use shielded and twisted cabling for the signal and motor power cables to reduce electrical noise.

3.7.3 Shock Hazard Reduction
See the Your responsibility and Safety Guidelines sections for safety information that must be followed to reduce shock hazard.
4 Model Nomenclature

P-Series
P8  P8000 Series

Current Rating
03  3.0 \(A_{\text{rms}}\) continuous (AC models only)
06  5.5 \(A_{\text{rms}}\) continuous (DC models only)

Voltage Range
3  24-75 V\(_{\text{dc}}\)
6  100-240 V\(_{\text{ac}}\), single-phase

Customization
Omit field for standard configurations
001, 002, 003... = Special

Functionality
SDN  Pulse Input Step/Direction or CW/CCW (Open Loop, DC model only)
R4E  Modbus RS485 RTU programmable (Open or Close Loop, AC model only)

Electrical Options
0  None
5 Technical Data Overview

- Power Supply: 24-75 V\text{DC}
- Phase Current: up to 5.5 A_{\text{RMS}} (7.8 A_{\text{peak}})
- Chopper Frequency: ultrasonic 40KHz
- Protections Against: over current, overvoltage/undervoltage, overheating, short circuit between motor phase-to-phase and phase-to-ground
- Emulated Step Angle: Full Step, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/5, 1/10, 1/20, 1/25, 1/30, 1/36, 1/50, 1/100 configurable by means of dip-switches
- Pulse Input (Step/Direction or CW/CCW) control mode
- Digital Inputs: 3 (Step, Direction, and Enable)
- Digital Outputs: 1 (Fault Output)
- Dimensions: 108 x 75.5 x 26 mm (without connectors)
- Weight: 200g
- Protection Degree: IP20
- Pollution Degree: 2
- Working Temperature: 5 °C to 40 °C
- Storage Temperature: -25 °C to 55 °C
- Humidity: 5% to 85%, non-condensing
6 Mechanical Data

CN1: Power Supply & Motor Connections
CN3: Digital Inputs/Outputs
CN6: Service SCI Interface

6.1 Mounting The P8000

Mount the P80630 drive to either a cold plate using four M4 screws located on the bottom plate of the drive or a panel wall using two M5 screws located on the back plate of the drive.

Your installation should meet the following guidelines:

- Securely fastened to a flat, solid, non-painted surface that will support the 200g mass (7.05 oz) to help conduct heat away from the chassis.
- Free of excessive vibration or shock
- Minimum unobstructed space of 1.5 in. (38.1 mm) of space around all sides.
- Maximum case temperature of 70 °C. If the case exceeds this temperature, it may shut down due to overheating and potentially reduce the lifespan of the drive. Fan cooling or a lower working temperature may be required to allow the drive to run properly.

⚠️ CAUTION ⚠️

Never put the drive where it can get wet or where metal or other electrically conductive particles can get on the circuitry.
6.2 Connections

NOTE: This connection is only possible with hardware and software provided by Kollmorgen.

6.2.1 CN1: Power Supply & Motor Connections

6 position, pitch 5.08mm, PCB header connector

**NOTE**
The Service SCI Interface is only used for field maintenance or applicable firmware changes performed in conjunction with the Kollmorgen Customer Support team.
6.3 Switches Settings

This chapter explains how to configure the P80630 using the dip-switches. The intent is to familiarize the P80630 user with the hardware adjustments and settings required to power and operate the P80630 drive.

The device reads the dip-switches only during the power up sequence. If it's necessary to change settings, shut down the system, change the settings and start up the system again to implement the changes.

6.3.1 Dip-Switches Setting - Motor Phase Current

<table>
<thead>
<tr>
<th>Motor Phase Current, $A_{\text{RMS}}$ (Apeak)</th>
<th>SW1</th>
<th>SW2</th>
<th>SW3</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.5 (7.8)</td>
<td>OFF</td>
<td></td>
<td></td>
<td>OFF</td>
</tr>
<tr>

<td>2.2 (3.2)</td>
<td>OFF</td>
<td>ON</td>
<td>ON</td>
<td></td>
</tr>
<tr>
<td>1.7 (2.4)</td>
<td>ON</td>
<td>ON</td>
<td>ON</td>
<td></td>
</tr>
</tbody>
</table>

The default unit is $A_{\text{RMS}}$. $A_{\text{RMS}}$ is calculated by dividing the Apeak value by 1.41.
6.3.2 Dip-Switches Setting – Idle Current Reduction

**NOTE**

Idle Current Reduction automatically reduces the motor phase current at times when no motion is commanded. Motor current is reduced 1.0 seconds after no step commands are received. Setting SW4 to OFF cuts motor current to 90% of its commanded value, while setting SW4 to ON cuts motor current to 50% of its commanded value. It is recommended to use the 90% setting when high holding torque is required in the application.

<table>
<thead>
<tr>
<th>SW4</th>

<tbody>
<tr>
<td>OFF</td>
<td>Idle current reduction to 90%</td>
<td></td>
</tr>
<tr>
<td>ON</td>
<td>Idle current reduction to 50%</td>
<td>X</td>
</tr>
</tbody>
</table>
6.3.3 Dip-Switches Setting - Motor Step Resolution

**NOTE**
Motor Step Resolution sets the amount of rotation per input step. For all stepper motors with a 1.8 degree step angle, steps per revolution can be calculated using the table shown. The advantages of a smaller microstep size, such as 1/8 or smaller, are:

- Higher resolution
- Smoother low speed operation
- Ability to operate in low-speed resonance regions

<table>

When any of the following situations occur, the drive is placed in a fault condition.

<table>
<thead>
<tr>
<th>Defect</th>
<th>Cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intervention of the thermal protection</td>
<td>Can be caused by a prolonged duty cycle, high current in the motor, or high voltage paired with a low inductance motor</td>
<td>Improve the drive cooling by a natural or fan airflow. Consider using a motor with a higher torque vs. current rating.</td>
</tr>
<tr>
<td>Intervention of the current protection</td>
<td>Short circuit on the motor power stage (s) of the drive</td>
<td>Check the motor windings and cables to remove the short circuits; replace any faulty cables or the motor if necessary</td>
</tr>
<tr>
<td>Intervention of the over/under voltage protection</td>
<td>Supply voltage out of range</td>
<td>Check the value for the supply voltage.</td>
</tr>
<tr>
<td>Open phase motor protection</td>
<td>Motor windings to the drive are not connected properly</td>
<td>Check the motor cables and connections to the drive.</td>
</tr>
</tbody>
</table>

**NOTE**

The fault condition will remain until the drive is reset by the following method:
- Power Cycle

**CAUTION**

Remember to avoid ON/OFF switching of any DC connection to the drive.

Hard-wire the drive to the power supply and switch the power supply AC input ON/OFF instead. Switching the DC to the drive results in very high inrush currents. This could potentially damage the P8000 drive or the ON/OFF switch.
8 Digital Input Connections

Single-ended PNP or NPN and Differential Line Driver type (5 – 24 V\textsubscript{DC} Inputs)

The P80630 stepper drive has two inputs dedicated to step (STEP) and direction (DIR). They accept a nominal range of 5-24 V\textsubscript{DC} signals up to 200 kHz. The threshold switching voltage represents the min. supply voltage (amplitude of waveform) that may be recognized by the input. The limit is 2.5 +/- 10% V\textsubscript{DC}. Therefore, in some cases with an input voltage of 5 V\textsubscript{DC} peak-to-peak, a voltage offset of +0.5 V\textsubscript{DC} or greater may be required to trigger the input.

The STEP input is used to command motor rotation. The motor executes one step when the STEP input closes. The minimum pulse width (ON/OFF) times are 0.5\(\mu\text{s}\) (500 ns). Pulses that do not meet the minimum times may be ignored by the drive’s electronics.

**NOTE**

Alternatively, the STEP input can be used as a Clock Up input to rotate the motor clockwise (CW) or counterclockwise (CCW) depending on the wiring configuration. If wired according to the **Motor Phase Connection Configurations Diagram** Clock Up should result in CCW rotation when closed (5-24V\textsubscript{DC} applied).
The DIR input is used to control direction of rotation. If wired according to the Motor Phase Connection Configurations Diagram, an open input (0 VDC) will result in clockwise (CW) rotation and a closed input (5-24 VDC applied) will result in counterclockwise (CCW) rotation. If necessary, once power is removed, the direction can be reversed by reversing the connection of either (not both) of the motor phase connectors (i.e. switching A+ & A- OR B+ & B-).

**NOTE**

- Allow for a 50µs setup time from changes at the DIR input prior to transition of the STEP input. Failure to meet setup time can result in the drive misinterpreting the intended direction of a step.
- Alternatively, the DIR input can be used as a Clock Down input to rotate the motor CW or CCW depending on the wiring configuration. If wired according to the Motor Phase Connection Configurations Diagram Clock Down should result in CW rotation when closed (5-24 VDC applied).

The Enable (EN) input is used to enable or disable the P80630's power stage. This input accepts a nominal range of 5-24 VDC signals up to 20 kHz. The threshold switching voltage represents the min. supply voltage (amplitude of waveform) that may be recognized by the input. The limit is 2.5 +/- 10% VDC. Therefore, in some cases with an input voltage of 5 VDC peak-to-peak, a voltage offset of +0.5 VDC or greater may be required to trigger the input. When the EN input is closed (5-24 VDC applied), the drive is deactivated (disabled); all the transistors will shut down and the motor will be free. When the EN input is open (0 VDC), the drive is activated (enabled); motor is powered.
9 Digital Output Connections

PNP with $V_{OUT} = 5\text{-}24\, V_{DC}$, $I_{OUT\text{max}} = 100\, mA$, $F_{max} = 2\, kHz$.

NPN with $V_{OUT} = 5\text{-}24\, V_{DC}$, $I_{OUT\text{max}} = 100\, mA$, $F_{max} = 2\, kHz$.

The P80630 stepper drive has one dedicated fault output to signal a fault condition in the drive amplifier. The maximum collector current is 100 mA, and the maximum collector to emitter voltage is $24V_{DC}$. The output can be wired as a PNP or NPN configuration based on your control logic input. When the drive is working normally, the output is active/closed (logic ‘1’). When the drive encounters an error, the output opens (logic ‘0’) and signals a fault condition via the LED lights. For more information about fault conditions, see Working Status (LED).
10 Mating Connectors

**NOTE**
These connectors can also be purchased from Kollmorgen by ordering CONKIT-P80360-R4E. See Accessories.

<td>6.3A Slow Blow (Class J or RK1 Time Delay)</td>
</tr>
</tbody>
</table>

**NOTE**

The Suggested External Fusing refers to any applicable external fuse on the power supply. External fusing should be wired in series over the positive power supply input. In addition, there is a 10A internal fuse across the power supply inputs (V+ and V-) on the P80630-SDN drive. If you suspect the internal fuse is damaged, contact Kollmorgen Customer Support to evaluate repair or replacement options.
13 Regulatory Information

13.1 Conformance with RoHS
The device is manufactured in conformance with RoHS Directive 2011/65/EU with delegated directive 2015/863/EU for installation into a machine.

13.2 Conformance with EU

Kollmorgen declares the conformity of the product series P80630-SDN with the following directives: EU Directive 2014/30/EU, EMC Directive, using harmonized standard EN 61800-3. EU Declarations of Conformity can be found on the Kollmorgen website.

The drives have been tested by an authorized testing laboratory using the configuration described in this documentation. The user is responsible for ensuring conformance with regulatory requirements.
Support and Services

About KOLLMORGEN

Kollmorgen is a leading provider of motion systems and components for machine builders. Through world-class knowledge in motion, industry-leading quality and deep expertise in linking and integrating standard and custom products, Kollmorgen delivers breakthrough solutions that are unmatched in performance, reliability and ease-of-use, giving machine builders an irrefutable marketplace advantage.

Join the Kollmorgen Developer Network for product support. Ask the community questions, search the knowledge base for answers, get downloads, and suggest improvements.
