

Kollmorgen Automation Suite

KAS Reference Manual - Motion Library

Document Edition: G, February 2016

Valid for KAS Software Revision 2.10

Part Number: 959716

Keep all manuals as a product component during the life span of the product.
Pass all manuals to future users / owners of the product.

2.1.5.56.2	Arguments	173
2.1.5.57.3.1	Input	173
2.1.5.58.4.2	Output	173
2.1.5.59.5	Related Functions	173
2.1.5.60.6	Previous Function Name	173
2.1.5.61.7	Example	173
2.1.5.62.8.1	Structured Text	173
2.1.5.63.9.2	Ladder Diagram	174
2.1.5.64.10.3	Function Block Diagram	174
2.1.5.65	MLPrfWriteIOffset	174
2.1.5.66.1	Description	174
2.1.5.67.2	Arguments	174
2.1.5.68.3.1	Input	174

2.1.5.69.4.2	Output	174
2.1.5.70.5.3	Return Type	175
2.1.5.71.6	Related Functions	175
2.1.5.72.7	Example	175
2.1.5.73.8.1	Structured Text	175
2.1.5.74.9.2	Ladder Diagram	175
2.1.5.75.10.3	Function Block Diagram	175
2.1.5.76	MLPrfWriteScale	175
2.1.5.77.1	Description	175
2.1.5.78.2	Arguments	176
2.1.5.79.3.1	Input	176
2.1.5.80.4.2	Output	176
2.1.5.81.5.3	Return Type	176
2.1.5.82.6	Related Functions	176
2.1.5.83.7	Previous Function Name	176
2.1.5.84.8	Example	176
2.1.5.85.9.1	Structured Text	176
2.1.5.86.10.2	Ladder Diagram	177
2.1.5.87.11.3	Function Block Diagram	177
2.1.5.88	MLPrfWriteOOffset	177
2.1.5.89.1	Description	177
2.1.5.90.2	Arguments	177
2.1.5.91.3.1	Input	177
2.1.5.92.4.2	Output	178
2.1.5.93.5.3	Return Type	178
2.1.5.94.6	Related Functions	178
2.1.5.95.7	Example	178
2.1.5.96.8.1	Structured Text	178
2.1.5.97.9.2	Ladder Diagram	178
2.1.5.98.10.3	Function Block Diagram	178
2.1.5.99	MLPrfWriteOScale	178
2.1.5.100.1	Description	178
2.1.5.101.2	Arguments	179
2.1.5.102.3.1	Input	179
2.1.5.103.4.2	Output	179
2.1.5.104.5.3	Return Type	179
2.1.5.105.6	Related Functions	179
2.1.5.106.7	Previous Function Name	179
2.1.5.107.8	Example	179

2.1.5.108.9.1	Structured Text	179
2.1.5.109.10.2	Ladder Diagram	180
2.1.5.110.11.3	Function Block Diagram	180
2.1.6	Motion Library - Comparator	180
2.1.6.1	MLCompCheck	180
2.1.6.2.1	Description	180
2.1.6.3.2	Arguments	181
2.1.6.4.3.1	Input	181
2.1.6.5.4.2	Output	181
2.1.6.6.5.3	Return Type	181
2.1.6.7.6	Related Functions	181
2.1.6.8.7	Example	182
2.1.6.9.8.1	Structured Text	182
2.1.6.10.9.2	Ladder Diagram	182
2.1.6.11.10.3	Function Block Diagram	182
2.1.6.12	MLComplnit	182
2.1.6.13.1	Description	182
2.1.6.14.2	Arguments	182
2.1.6.15.3.1	Input	182
2.1.6.16.4.2	Output	183
2.1.6.17.5.3	Return Type	183
2.1.6.18.6	Related Functions	183
2.1.6.19.7	Example	183
2.1.6.20.8.1	Structured Text	183
2.1.6.21.9.2	Ladder Diagram	183
2.1.6.22.10.3	Function Block Diagram	184
2.1.6.23	MLCompReadRef	184
2.1.6.24.1	Description	184
2.1.6.25.2	Arguments	184
2.1.6.26.3.1	Input	184
2.1.6.27.4.2	Output	184
2.1.6.28.5	Related Functions	184
2.1.6.29.6	Example	184
2.1.6.30.7.1	Structured Text	184
2.1.6.31.8.2	Ladder Diagram	185
2.1.6.32.9.3	Function Block Diagram	185
2.1.6.33	MLCompReset	185
2.1.6.34.1	Description	185
2.1.6.35.2	Arguments	185

2.1.6.36.3.1 Input	185
2.1.6.37.4.2 Output	185
2.1.6.38.5.3 Return Type	185
2.1.6.39.6 Related Functions	185
2.1.6.40.7 Example	185
2.1.6.41.8.1 Structured Text	185
2.1.6.42.9.2 Ladder Diagram	186
2.1.6.43.10.3 Function Block Diagram	186
2.1.6.44 MLCompWriteRef	186
2.1.6.45.1 Description	186
2.1.6.46.2 Arguments	186
2.1.6.47.3.1 Input	186
2.1.6.48.4.2 Output	187
2.1.6.49.5.3 Return Type	187
2.1.6.50.6 Related Functions	187
2.1.6.51.7 Example	187
2.1.6.52.8.1 Structured Text	187
2.1.6.53.9.2 Ladder Diagram	187
2.1.6.54.10.3 Function Block Diagram	187
2.1.6.55 Usage example of Comparator Functions	188
2.1.7 Motion Library - Convertor	190
2.1.7.1 MLCNVConnect	191
2.1.7.2.1 Description	191
2.1.7.3.2 Arguments	191
2.1.7.4.3.1 Input	191
2.1.7.5.4.2 Output	191
2.1.7.6.5.3 Return Type	192
2.1.7.7.6 Related Functions	192
2.1.7.8.7 Example	192
2.1.7.9.8.1 Structured Text	192
2.1.7.10.9.2 Ladder Diagram	192
2.1.7.11.10.3 Function Block Diagram	192
2.1.7.12 MLCNVConnectEx	192
2.1.7.13.1 Description	192
2.1.7.14.2 Arguments	192
2.1.7.15.3.1 Input	193
2.1.7.16.4.2 Output	193
2.1.7.17.5.3 Return Type	194
2.1.7.18.6 Related Functions	194
2.1.7.19.7 Example	194

2.1.7.20.8.1	Structured Text	194

2.1.16.43.4.2 Output	284
2.1.16.44.5 Example	284
2.1.16.45.6.1 Structured Text	284
2.1.16.46.7.2 Ladder Diagram	284
2.1.16.47.8.3 Function Block Diagram	285
2.1.16.48 Usage example of Synchronizer Functions	285
2.1.17 Motion Library - Trigger	286
2.1.17.1 MLTrigClearFlag	286
2.1.17.2.1 Description	286
2.1.17.3.2 Arguments	286
2.1.17.4.3.1 Input	287

2.1.17.5.4.2 Output	287
2.1.17.6.5.3 Return Type	287
2.1.17.7.6 Related Functions	287
2.1.17.8.7 Example	287
2.1.17.9.8.1 Structured Text	287
2.1.17.10.9.2 Ladder Diagram	287
2.1.17.11.10.3 Function Block Diagram	287
2.1.17.12 MLTrigInit	287
2.1.17.13.1 Description	287
2.1.17.14.2 Arguments	288
2.1.17.15.3.1 Input	288
2.1.17.16.4.2 Output	288
2.1.17.17.5.3 Return Type	288
2.1.17.18.6 Related Functions	288
2.1.17.19.7 Example	289
2.1.17.20.8.1 Structured Text	289
2.1.17.21.9.2 Ladder Diagram	289
2.1.17.22.10.3 Function Block Diagram	289
2.1.17.23 MLTrigsTriggered	289
2.1.17.24.1 Description	289
2.1.17.25.2 Arguments	290
2.1.17.26.3.1 Input	290
2.1.17.27.4.2 Output	290
2.1.17.28.5.3 Return Type	290
2.1.17.29.6 Related Functions	290
2.1.17.30.7 Example	290
2.1.17.31.8.1 Ladder Diagram	291
2.1.17.32.9.2 Function Block Diagram	291
2.1.17.33 MLTrigReadDelay	291
2.1.17.34.1 Description	291
2.1.17.35.2.1 Input	291
2.1.17.36.3.2 Output	291
2.1.17.37.4 Related Functions	291
2.1.17.38 MLTrigReadPos	292
2.1.17.39.1 Description	292
2.1.17.40.2 Arguments	292
2.1.17.41.3.1 Input	292
2.1.17.42.4.2 Output	292
2.1.17.43.5 Related Functions	292

2.1.17.44.6	Previous Function Name	293
2.1.17.45.7	Example	293

2.1.17.47.9.2	Ladder Diagram	293
2.1.17.48.10.3	Function Block Diagram	293
2.1.17.49	MLTrigReadTime	293
2.1.17.50.1	Description	293
2.1.17.51.2	Arguments	294
2.1.17.52.3.1	Input	294
2.1.17.53.4.2	Output	294
2.1.17.54.5	Related Functions	294
2.1.17.55.6	Previous Function Name	294
2.1.17.56.7	Example	294
2.1.17.57.8.1	Ladder Diagram	295
2.1.17.58.9.2	Function Block Diagram	295
2.1.17.59	MLTrigSetEdge	295
2.1.17.60.1	Description	295
2.1.17.61.2	Arguments	295
2.1.17.62.3.1	Input	295
2.1.17.63.4.2	Output	295
2.1.17.64.5.3	Return Type	295
2.1.17.65.6	Examples	295
2.1.17.66.7.1	Function Block Diagram	295
2.1.17.67.8.2	Ladder Diagram	296
2.1.17.68.9.3	Structured Text	296
2.1.17.69	MLTrigWriteDelay	296
2.1.17.70.1	Description	296
2.1.17.71.2.1	Input	296
2.1.17.72.3.2	Output	296
2.1.17.73.4.3	Return Type	296
2.1.17.74.5	Related Functions	297
2.1.17.75	Usage example of Trigger Functions	297
2.2	Motion Library / PLCopen	298
2.2.1	Control Functions	299
2.2.1.1	MC_ClearFaults	299
2.2.1.2.1	Description	299
2.2.1.3.2	Arguments	300
2.2.1.4.3.1	Input	300
2.2.1.5.4.2	Output	300
2.2.1.6.5	Usage	300

2.2.1.7.6 Related Functions	300
2.2.1.8.7 Example	300
2.2.1.9.8.1 Structured Text	300
2.2.1.10.9.2 Ladder Diagram	300
2.2.1.11 MC_CreateAxis	301
2.2.1.12.1 Description	301
2.2.1.13.2 Arguments	301
2.2.1.14.3.1 Input	301
2.2.1.15.4.2 Output	302
2.2.1.16.5 Example	303
2.2.1.17.6.1 Structured Text	303
2.2.1.18.7.2 Ladder Diagram	303
2.2.1.19 MC_EStop	303
2.2.1.20.1 Description	303
2.2.1.21.2 Arguments	303
2.2.1.22.3.1 Input	303
2.2.1.23.4.2 Output	304
2.2.1.24.5 Usage	304
2.2.1.25.6 Related Functions	304
2.2.1.26.7 Example	304
2.2.1.27.8.1 Structured Text	304
2.2.1.28.9.2 Ladder Diagram	304
2.2.1.29 MC_InitAxis	304
2.2.1.30.1 Description	304
2.2.1.31.2 Arguments	305
2.2.1.32.3.1 Input	305
2.2.1.33.4.2 Output	306
2.2.1.34.5 Example	306
2.2.1.35.6.1 Structured Text	306
2.2.1.36.7.2 Ladder Diagram	306
2.2.1.37 MC_Power	306
2.2.1.38.1 Description	306
2.2.1.39.2 Arguments	307
2.2.1.40.3.1 Input	307
2.2.1.41.4.2 Output	308
2.2.1.42.5 Example	308
2.2.1.43.6.1 Structured Text	308
2.2.1.44.7.2 Ladder Diagram	308
2.2.1.45 MC_ErrorDescription	308

2.2.1.46.1 Arguments	309
2.2.1.47.2.1 Inputs	309
2.2.1.48.3.2 Outputs	309
2.2.1.49.4 Examples	309
2.2.1.50.5.1 Structured Text	309

2.2.2 I/O Functions	313
2.2.2.1 MC_AbortTrigger	313
2.2.2.2.1 Description	313
2.2.2.3.2 Arguments	313
2.2.2.4.3.1 Input	313
2.2.2.5.4.2 Output	314
2.2.2.6.5 Usage	315
2.2.2.7.6 Related Functions	315
2.2.2.8.7 Example	315
2.2.2.9.8.1 Structured Text	315
2.2.2.10.9.2 Ladder Diagram	315
2.2.2.11 MC_TouchProbe	315
2.2.2.12.1 Description	315
2.2.2.13.2 Arguments	316

2.2.2.14.3.1 Input	316
2.2.2.15.4.2 Output	318
2.2.2.16.5 Usage	318
2.2.2.17.6 Limitations	318
2.2.2.18.7 Related Functions	318
2.2.2.19.8 Example	318
2.2.2.20.9.1 Structured Text	318
2.2.2.21.10.2 Ladder Diagram	319
2.2.3 Information Functions	319
2.2.3.1 MC_ReadActPos	319
2.2.3.2.1 Description	319
2.2.3.3.2 Arguments	319
2.2.3.4.3.1 Input	319
2.2.3.5.4.2 Output	320
2.2.3.6.5 Example	320
2.2.3.7.6.1 Structured Text	320
2.2.3.8.7.2 Ladder Diagram	320
2.2.3.9 MC_ReadActVel	321
2.2.3.10.1 Description	321
2.2.3.11.2 Arguments	321
2.2.3.12.3.1 Input	321
2.2.3.13.4.2 Output	321
2.2.3.14.5 Example	321
2.2.3.15.6.1 Structured Text	321
2.2.3.16.7.2 Ladder Diagram	322
2.2.3.17 MC_ReadAxisErr	322
2.2.3.18.1 Description	322
2.2.3.19.2 Arguments	322
2.2.3.20.3.1 Input	322
2.2.3.21.4.2 Output	322
2.2.3.22.5 Example	323
2.2.3.23.6.1 Structured Text	323
2.2.3.24.7.2 Ladder Diagram	323
2.2.3.25 MC_ReadBoolPar	323
2.2.3.26.1 Description	323
2.2.3.27.2 Arguments	324
2.2.3.28.3.1 Input	324
2.2.3.29.4.2 Output	324
2.2.3.30.5 Example	324

2.2.3.31.6.1	Structured Text	324
2.2.3.32.7.2	Ladder Diagram	324
2.2.3.33	MC_ReadParam	325
2.2.3.34.1	Description	325
2.2.3.35.2	Arguments	325
2.2.3.36.3.1	Input	325
2.2.3.37.4.2	Output	325
2.2.3.38.5	Example	326
2.2.3.39.6.1	Structured Text	326
2.2.3.40.7.2	Ladder Diagram	326
2.2.3.41	MC_ReadStatus	326
2.2.3.42.1	Description	326
2.2.3.43.2	Arguments	326
2.2.3.44.3.1	Input	326
2.2.3.45.4.2	Output	327
2.2.3.46.5	Example	327
2.2.3.47.6.1	Structured Text	328
2.2.3.48.7.2	Ladder Diagram	328
2.2.3.49	MC_WriteBoolPar	328
2.2.3.50.1	Description	328
2.2.3.51.2	Arguments	328
2.2.3.52.3.1	Input	328
2.2.3.53.4.2	Output	329
2.2.3.54.5	Example	329
2.2.3.55.6.1	Structured Text	329
2.2.3.56.7.2	Ladder Diagram	329
2.2.3.57	MC_WriteParam	329
2.2.3.58.1	Description	329
2.2.3.59.2	Arguments	329
2.2.3.60.3.1	Input	329
2.2.3.61.4.2	Output	330
2.2.3.62.5	Example	330
2.2.3.63.6.1	Structured Text	330
2.2.3.64.7.2	Ladder Diagram	330
2.2.4	PLCOpenMotion Functions	331

5.2.3.1 Description	548
5.2.3.2 Arguments	548
5.2.3.3.1 Input	548
5.2.3.4.2 Output	548
5.2.3.5 Usage	549
5.2.3.6 Example	549
5.2.3.7.1 Structured text	549
5.2.3.8.2 Function Block Diagram	549
5.2.3.9.3 Free Form Ladder Diagram	549
5.2.4 PipeNetwork_FFLD	550
5.2.4.1 Description	550
5.2.4.2 Arguments	550
5.2.4.3.1 Inputs	550
5.2.4.4.2 Outputs	551
5.2.4.5 Usage	551
5.2.4.6 Example	551
5.2.4.7.1 FFLD	551
5.2.5 ProfilesCode_FFLD	551
5.2.5.1 Description	551
5.2.5.2 Arguments	552
5.2.5.3.1 Inputs	552
5.2.5.4.2 Outputs	552
5.2.5.5 Usage	552
5.2.5.6 Example	552
5.2.5.7.1 FFLD	552
5.2.6 FB_TemperaturePID	553
5.2.6.1 Description	553
5.2.6.2 Arguments	553
5.2.6.3.1 Inputs	553
5.2.6.4.2 Outputs	553

5.2.6.5 Usage	554
5.2.6.6.1 Tuning Process	554
5.2.6.7.2 Start PID Controller	554
5.2.6.8 MLFB_HomeFindHomeInput	555
5.2.6.9.1 Description	555
5.2.6.10.2 Arguments	555
5.2.6.11.3.1 Input	555
5.2.6.12.4.2 Output	556
5.2.6.13.5 Example	556
5.2.6.14.6.1 Function Block Diagram	556
5.2.6.15 MLFB_HomeFindHomeInputThenZeroAngle	557
5.2.6.16.1 Description	557
5.2.6.17.2 Arguments	557
5.2.6.18.3.1 Input	557
5.2.6.19.4.2 Output	558
5.2.6.20.5 Example	558
5.2.6.21.6.1 Function Block Diagram	558
5.2.6.22 MLFB_HomeFindLimitInput	558
5.2.6.23.1 Description	558
5.2.6.24.2 Arguments	558
5.2.6.25.3.1 Input	558
5.2.6.26.4.2 Output	559
5.2.6.27.5 Example	559
5.2.6.28.6.1 Function Block Diagram	559
5.2.6.29 MLFB_HomeFindLimitInputThenZeroAngle	559
5.2.6.30.1 Description	560
5.2.6.31.2 Arguments	560
5.2.6.32.3.1 Input	560
5.2.6.33.4.2 Output	560
5.2.6.34.5 Example	561
5.2.6.35.6.1 Function Block Diagram	561
5.2.6.36 MLFB_HomeFindZeroAngle	561
5.2.6.37.1 Description	561
5.2.6.38.2 Arguments	561
5.2.6.39.3.1 Input	561
5.2.6.40.4.2 Output	562
5.2.6.41.5 Example	562
5.2.6.42.6.1 Function Block Diagram	562
5.2.6.43 MLFB_HomeMoveUntilPosErrExceeded	562

5.2.6.44.1 Description	562
5.2.6.45.2 Arguments	562
5.2.6.46.3.1 Input	562
5.2.6.47.4.2 Output	563
5.2.6.48.5 Example	563
5.2.6.49.6.1 Function Block Diagram	563
5.2.6.50 MLFB_HomeMoveUntilPosErrExceededThenZeroAngle	564
5.2.6.51.1 Description	564
5.2.6.52.2 Arguments	564
5.2.6.53.3.1 Input	564
5.2.6.54.4.2 Output	564
5.2.6.55.5 Example	565
5.2.6.56.6.1 Function Block Diagram	565
5.2.6.57 MLFB_HomeUsingCurrentPosition	565

2 Motion Library

2.1 Motion Library / Pipe Network	80
2.2 Motion Library / PLCopen	298
2.3 MotionLibrary- Common	406

This chapter covers the Motion Library (for **Pipe Network** and **PLCopen**) in the function blocks tab of the Library toolbox.

KAS function library contains ML function blocks that are used to integrate motion in a PLC program. ML function blocks can be used in 4 of the IEC 61131-3 languages: ST, FBD, FFLD and IL.

Regarding SFCSFC programs, ML function blocks (like any other function blocks from the library) are used as part of a stepstep or transitiontransition which are defined with ST, FBD, FFLD or IL languages.

2.1 Motion Library / Pipe Network

The KAS IDE function library contains ML function blocks that are used to integrate motion from a Pipe Network in a PLC program. ML Function blocks are of the following types:

Function	Description
Motion	Prepare the physical motion part: init, reset, start, stop
Pipe Network	Manage the Pipe Network: create/activate
Block	Manage the blocks: create/activate
Pipe Block	Manage each specific Pipe Block: read/write parameters...

Table 1-1: List of Pipe Network FB

! IMPORTANT

Pipe Network code is generated automatically by the compiler, you should not try to modify it.

2.1.1 Motion Library - Pipe Network

Name	Description	Return type
MLPipeAct	Activates a pipe	BOOL
MLPipeAddBlock	Adds a Pipe Block to a pipe	BOOL
MLPipeCreate	Creates a new pipe object	None
MLPipeDeact	Deactivates a pipe	BOOL

2.1.1.1 MLPipeAct

2.1.1.2.1 Description

Activates a pipe. A Pipe contains an Input Pipe Block (Master, PMP, or Sampler), a Converter Output Pipe Block, and any Transformation Pipe Block that can be in between. The figure below shows two Pipes, both with the same Master Input Pipe Block. The first ends with the first converter, and has a Gear Pipe Block to transform the input values from the Master. The second pipe ends with the second converter, and has a CAM Pipe Block to modify the input values from the Master.

Once a Pipe is activated then history on the values in the Pipe's Blocks are saved and updated each program cycle. A Converter object connected to a destination Axis object cannot send updated position values unless its Pipe is activated.

Figure 1-1: MLPipeAct

NOTE

All Pipes in the Pipe Network can be activated at once with the command `PipeNetwork(MLPN_ACTIVATE)`. This calls automatically generated code with `MLPipeAct` commands for each Pipe object. Therefore, in a multi-pipe program only one command can be used to activate Pipes instead of writing code for each Pipe separately.

2.1.1.3.2 Arguments

2.1.1.4.3.1 Input

PipeID	Description	ID number of a created Pipe object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.1.5.4.2 Output

Default (.Q)	Description	Returns TRUE if the Pipe is activated
	Data type	BOOL
	Unit	n/a

2.1.1.6.5.3 Return Type

BOOL

2.1.1.7.6 Related Functions

2.1.1.9.8.1 Structured Text

```
//Activate a Pipe
MLPipeAct ( PipeAXIS1 );
```

2.1.1.10.9.2 Ladder Diagram

2.1.1.11.10.3 Function Block Diagram

2.1.1.12 MLPipeAddBlock

2.1.1.13.1 Description

Add a Pipe Block to a pipe. A Pipe contains an Input Pipe Block (Master, PMP, or Sampler), a Converter Output Pipe Block, and any Transformation Pipe Block that can be in between.

The figure below shows two Pipes, both with the same Master Input Pipe Block. If a user were to create the Pipe 1 below without using the Graphical Engine, they would use the following commands once a Pipe and the Pipe Blocks have been created.

```
MLPipeAddBlock( PipeAXIS1, MASTER);
MLPipeAddBlock( PipeAXIS1, MyGear);
MLPipeAddBlock( PipeAXIS1, CNV1);
```

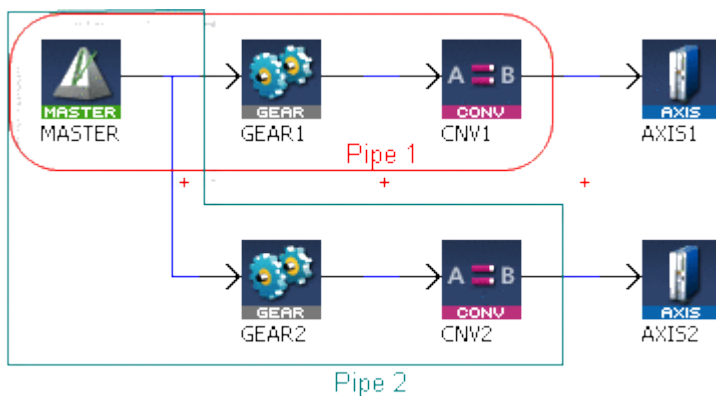

Figure 1-2: MLPipeAddBlock

NOTE

All Blocks in the Pipe Network are added to a Pipe automatically. Code with MLPipeAddBlock commands are automatically generated and called in a program with PipeNetwork(MLPN_CREATE_OBJECTS). Therefore, when using the Pipe Network graphical engine to create Pipe Blocks the user does not have to manually add MLPipeAddBlock commands to the Project.

2.1.1.14.2 Arguments

2.1.1.15.3.1 Input

PipeID	Description	ID number of a created Pipe
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
BlockID	Description	ID number of a created Pipe object to add to the selected Pipe
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.1.16.4.2 Output

Default (.Q)	Description	Returns TRUE if the Pipe Block is added to the Pipe
	Data type	BOOL
	Unit	n/a

2.1.1.17.5.3 Return Type

BOOL

2.1.1.23 MLPipeCreate

2.1.1.24.1 Description

Create a new pipe object. A Pipe contains an Input Pipe Block (Master, PMP, or Sampler), a Converter Output Pipe Block, and any Transformation Pipe Block that can be in between. The figure below shows two Pipes, both with the same Master Input Pipe Block.

NOTE

Pipes are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLPipeCreate function blocks to their programs. Pipes are created graphically, and the code with MLPipeCreate commands are automatically generated and called in a program with PipeNetwork(MLPN_CREATE_OBJECTS).

2.1.1.25.2 Arguments

2.1.1.26.3.1 Input

Name	Description	Desired name for the newly created Pipe
	Data type	String
	Range	—
	Unit	n/a
	Default	—

2.1.1.27.4.2 Output

ID	Description	Assigned ID number of the created Pipe
	Data type	DINT
	Unit	n/a
	Default	—

2.1.1.31.8.2 Ladder Diagram

2.1.1.32.9.3 Function Block Diagram

2.1.1.33 MLPipeDeact

2.1.1.34.1 Description

Deactivates a pipe. A Pipe contains an Input Pipe Block (Master, PMP, or Sampler), a Converter Output Pipe Block, and any Transformation Pipe Block that can be in between. The figure below shows two Pipes, both with the same Master Input Pipe Block. The first ends with the first converter, and has a Gear Pipe Block to transform the input values from the Master. The second pipe ends with the second converter, and has a CAM Pipe Block to modify the input values from the Master.

Once a Pipe is activated then history on the values in the Pipe's Blocks are lost and no longer updated. A Converter object connected to a destination Axis object cannot send updated position values once its Pipe is deactivated.

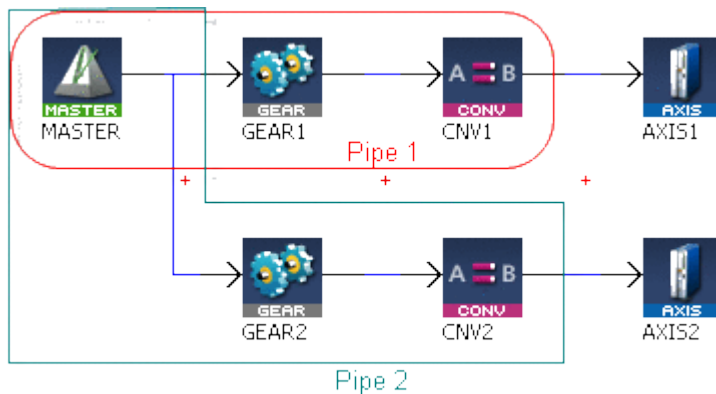

Figure 1-3: MLPipeDeact

NOTE

All Pipes in the Pipe Network can be deactivated at once with the command `PipeNetwork(MLPN_DEACTIVATE)`. This calls automatically generated code with `MLPipeDeact` commands for each Pipe object. Therefore, in a multi-pipe program only one command can be used to deactivate Pipes instead of writing code for each Pipe separately.

2.1.1.35.2 Arguments

2.1.1.36.3.1 Input

PipeID	Description	ID number of a created Pipe object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.1.37.4.2 Output

Default (.Q)	Description	Returns TRUE if the Pipe is deactivated
	Data type	BOOL
	Unit	n/a

2.1.1.38.5.3 Return Type

BOOL

2.1.2 Motion Library - Block

Name	Description	Return type
"MLBlkCreate" (→ p. 86)	Creates a new Pipe Block object	None
"MLBlkIsReady" (→ p. 90)	Checks if a Pipe Block currently has a function running	BOOL
"MLBlkReadModPos" (→ p. 89)	Gets the value of the period of a block in user units	None
"MLBlkReadOutVal" (→ p. 88)	Gets the output value of a selected Pipe Block	None
"MLBlkWriteModPos" (→ p. 91)	Sets the value of the period of a block in user units	BOOL

2.1.2.1 MLBlkCreate

2.1.2.2.1 Description

Creates a new Pipe Block object. Before a Pipe Block is Initialized the block needs to be created and assigned an ID number. MLBlkCreate function block is automatically called if a Block is added to the Pipe Network.

NOTE

Pipe Blocks are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLBlkCreate function blocks to their programs. Blocks are created graphically, and the code with MLBlkCreate commands are automatically generated and called in a program with Pipe Network(MLPN_CREATE_OBJECTS).

TIP

This function must be called or executed before "MLMotionStart" (→ p. 421) is called.

2.1.2.3.2 Arguments

2.1.2.4.3.1 Input

Name	Description	Desired name for the newly created Pipe Block
	Data type	String
	Range	—
	Unit	n/a
	Default	—
Type	Description	Type of Pipe Block to create (ex. MASTER, GEAR, PHASER, etc.)
	Data type	String
	Range	—
	Unit	n/a
	Default	—

2.1.2.5.4.2 Output

ID	Description	Assigned ID number of the created Block

2.1.3 Motion Library - Adder

Name	Description	Return type
MLAddInit	Initializes an Adder Pipe Block with user-defined settings	BOOL
MLAddReadOff1	Returns the offset value of the first entry of an Adder block	None
MLAddReadOff2	Returns the offset value of the second entry of an Adder block	None
MLAddReadRatio1	Returns the ratio value of the first entry of an Adder block	None
MLAddReadRatio2	Returns the ratio value of the second entry of an Adder block	None

Name	Description	Return type
MLAddWriteInput	Sets the source of an input of an adder Pipe Block	BOOL
MLAddWriteOff1	Sets the offset value of the first entry of the Adder block	BOOL
MLAddWriteOff2	Sets the offset value of the second entry of the Adder block	BOOL
MLAddWriteRat1	Sets the ratio value of the first entry of the Adder block	BOOL
MLAddWriteRat2	Sets the ratio value of the second entry of the Adder block	BOOL

2.1.3.1 MLAddInit

2.1.3.2.1 Description

Initializes an Adder Pipe Block for use in a PLC Program. Function block is automatically called if an Adder Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Pipe Block is assigned ratios and offsets for both inputs. After an Adder block is initialized, the inputs still need to be selected using the MLAddWriteInput function block or graphically using the Pipe Network.

Adder Block Output = Ratio1*Input1 + Offset1 + Ratio2*Input2 + Offset2

Figure 1-6: MLAddInit

NOTE

Adder objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLAddInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.3.3.2 Arguments

2.1.3.4.3.1 Input

BlockID	Description	ID number of a created Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
Ratio1	Default	—
	Description	Sets the Ratio value of the first entry of an Adder object
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	—

Offset1	Description	Sets the Offset value of the first entry of an Adder object
	Data type	LREAL
	Range	—
	Unit	n/a
Ratio2	Description	Sets the Ratio value of the second entry of an Adder object
	Data type	LREAL
	Range	—
	Unit	n/a
Offset2	Description	Sets the Offset value of the second entry of an Adder object
	Data type	LREAL
	Range	—
	Unit	n/a

2.1.3.5.4.2 Output

Default (.Q)	Description	Returns TRUE if the Adder Pipe Block is initialized
	Data type	BOOL
	Unit	n/a

```

2.1.3.50.8.2 Ladder Diagram

2.1.3.51.9.3 Function Block Diagram

2.1.3.52 MAddWriteInput

2.1.3.53.1 Description

Sets the source of an input of an adder Pipe Block. Function block is automatically called if an Adder Block is connected to other blocks in the Pipe Network.

$$\text{Adder Block Output} = \text{Ratio1} * \text{Input1} + \text{Offset1} + \text{Ratio2} * \text{Input2} + \text{Offset2}$$

Figure 1-11: MAddWriteInput

NOTE

Adder objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MAddWriteInput function blocks to their programs. Blocks are connected with lines in the Pipe Network, and the code is then automatically added to the current project.

2.1.3.54.2 Arguments

2.1.3.55.3.1 Input

BlockID	Description	ID number of an initiated Adder object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
InputID	Description	Select first or second input to the Adder object
	Data type	DINT
	Range	[1, 2]
	Unit	n/a
	Default	—

InputBlockID	Description	ID number of an initiated Pipe Block which is an input to the Adder object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.3.56.4.2 Output

Default (.Q)	Description	Returns TRUE if the input to the Adder object is set
	Data type	BOOL
	Unit	n/a

2.1.3.57.5.3 Return Type

BOOL

2.1.4 Motion Library - Axis

TIP

- For an Axis function example, see "Usage Example of Axis Functions" on page 164

Function sorted by types:

Power Stage	Motion Control	Inquiry Functions	Position setting
MLAxisPower	MLAxisAbs	MLAxisGenPos	
MLAxisPowerDOff	MLAxisAdd	MLAxisPipePos	MLAxisReAlign
	MLAxisMoveVel	MLAxisCmdPos	
	MLAxisRel	MLAxisReadActPos	
	MLAxisStop	MLAxisFBackPos	
		MLAxisStatus	
		MLAxisReadGenStatus	
		MLAxisGenIsRdy	
		MLAxisTimeStamp	

Functions sorted in alphabetical order:

Name	Description	Return type
MLAxisAbs	Performs a move to an absolute position	BOOL
MLAxisAdd	Performs an additive move relative for a specified distance from the endpoint of the previous move	BOOL
MLAxisAddress	Returns the motion bus address of the axis	DINT
MLAxisAddTq	Sets additive torque	BOOL
MLAxisCfgFastIn	Initializes the Fast Input capability for the axis	BOOL
MLAxisCmdPos	Returns the reference position of the axis	None
MLAxisCreate	Creates a new axis object	None

Name	Description	Return type
MLAxisFBackPos	Returns the feedback position of the axis	None
MLAxisGenEN	Enables or disables the internal TMP generator of the axis	BOOL
MLAxisGenIsEN	Checks if the internal TMP generator of the axis is enabled	BOOL
MLAxisGenIsRdy	Checks if an axis is ready	BOOL
MLAxisGenPos	Returns the generator position of the axis	None
MLAxisGenReadAcc	Gets the acceleration of the internal generator of an axis	None
MLAxisGenReadDec	Gets the deceleration of the internal generator of an axis	None
MLAxisGenReadSpd	Gets the speed of the internal generator of an axis	None
MLAxisGenWriteAcc	Sets the acceleration of the internal generator of an axis	BOOL
MLAxisGenWriteDec	Sets the deceleration of the internal generator of an axis	BOOL
MLAxisGenWriteSpd	Sets the speed of the internal generator of an axis	BOOL
MLAxisInit	Initializes an axis object	BOOL
MLAxisIsCnctd	Checks if a pipe is currently connected to the axis	BOOL
MLAxisIsTriggered	Checks if the axis got a trigger event	BOOL
MLAxisMoveVel	Jogs at the specified speed	BOOL
MLAxisPipePos	Returns the pipe position of the axis	None
MLAxisPower	Powers up the axis. Enables Axis Servo Drive.	BOOL
MLAxisPowerDOff	Returns the adjustment of position done by the last power on to avoid bumps	None
MLAxisRatedTq	Sets rated motor torque	BOOL
MLAxisRead2ndFB	Read secondary feedback	None
MLAxisReadActPos	Returns the actual position of the axis	None
MLAxisReadFBUnit	Gets the feedback units per revolution value of the axis	None
MLAxisReadFEUU	Read following error in user units	None
MLAxisReadGenStatus	Returns the status of the internal generator of the axis	DINT
MLAxisReadModPos	Get the value period of the axis	None
MLAxisReadTq	Read actual torque	None
MLAxisReadUUnits	Get the user units per revolution value of the axis	None
MLAxisReadVel	Read actual velocity	None
MLAxisReAlignRdy	Checks if an axis is ready. Returns TRUE if the internal realignment axis is ready.	BOOL
MLAxisReAlign	Realigns the actual position with the reference position by moving the axis by the specified delta position	BOOL
MLAxisRel	Performs a relative move for a specified distance from the current position	BOOL
MLAxisResetErrors	Clears errors of the specified axis	BOOL

Name	Description	Return type
MLAxisRstFastIn	Resets the Fast Input	BOOL
MLAxisStatus	Returns the status of the axis	DINT
MLAxisStop	Stop with the specified deceleration	None
MLAxisTimeStamp	Returns the timestamp of the triggered axis	DINT
MLAxisWriteModPos	Sets the value period of the axis	BOOL
MLAxisWritePipPos	Forces the pipe position internal value. This function is working only when no pipe is connected.	BOOL
MLAxisWritePos	Sets the logical zero position of an axis	BOOL
MLAxisWriteUUnits	Sets the user units per revolution value of the axis	BOOL

2.1.4.1 MLAxisAbs

2.1.4.2.1 Description

Performs a move to an absolute position. Returns TRUE if the function succeeded.

2.1.4.3.2 Arguments

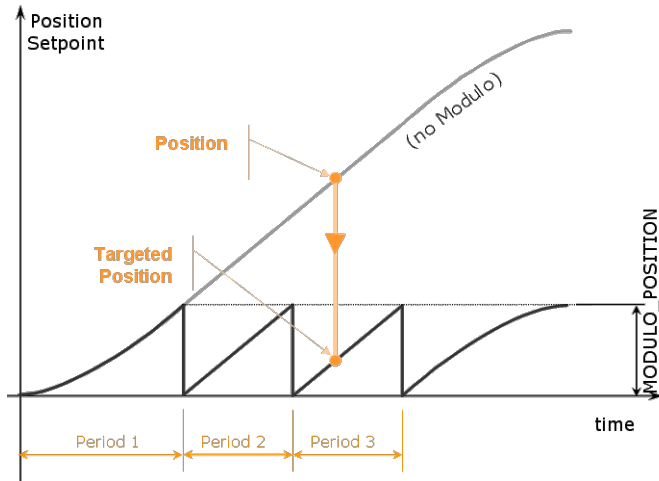

2.1.4.4.3.1 Input

ID	Description	ID name of the Axis Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Position	Description	Sets the value of the absolute destination position. When the Modulo is turned on, see more explanations below.
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.4.5 Position with Modulo On

When the Modulo is turned on, the Axis Block moves to the targeted position during the corresponding period, calculated as follows:

- If the Position input is between 0 and the Modulo Position, then the Axis Block moves within the **current** period (no position rollover).
- If the Position input is greater than the Modulo Position, then the Axis Block moves during one of the **next** period (positive position rollover).

The Axis Block works similarly for negative positions: if the Position input is less than zero, then the Axis Block moves during one of the **previous** period (negative position rollover).

2.1.4.6 Forcing the direction of rotation

In some applications, the direction of rotation for the axis is forced in one direction only. As a consequence, the motor movement goes to the next or previous modulo in the following situations:

- If the **End Position** is less than the **Start Position** and the direction of rotation for the axis is forced to be clockwise (the red point shows when the modulo position is reached)

(see an example in row#2 of the table below)

- If the **End Position** is greater than the **Start Position** and the direction of rotation for the axis is forced to be counter clockwise

(see an example in row#4 of the table below)

Examples

Start Position	End Position	Direction of rotation	Cross Modulo	Position Input to MLAxisAbs (1)	RelativeDistance Moved (2)	
60	200	clockwise	No	200	140	(i.e. 200 - 60 + 0)
60	30	clockwise	Yes	390	330	(i.e. 30 - 60 + 360)
60	30	counter clock-wise	No	30	-30	(i.e. 30 - 60 - 0)
60	200	counter clock-wise	Yes	-160	-220	(i.e. 200 - 60 - 360)

With:

(1) **Position Input** = End Position (+ Modulo * *Direction of rotation*)

(2) **Relative Distance Moved** = End Position - Start Position (+ Modulo * *Direction of rotation*)

Where:

Direction of rotation = 1 when clockwise and -1 when anti-clockwise

2.1.4.7 Travel Speed Update with MLAxisAbs

The travel speed of the generator can be updated using the function block "MLAxisGenWriteSpd" (→ p. 129). Depending on the state of the generator, this speed is directly reflected on the current move or a future move.

- If MLAxisAbs is not currently being executed, the new travel speed will be applied for the trajectory calculation for a future MLAxisAbs command.
- If MLAxisAbs is currently being executed and a new MLAxisAbs with the same target position is called, the new travel speed will be taken into account only if the current state of the TMP profile is the constant velocity or acceleration. If the axis was decelerating to stop at the goal position the new travel speed will not be taken into account.
- If a MLAxisAbs is currently being executed and a new MLAxisAbs with a different target position is called, the new travel speed is taken into account.

Following are several examples.

Figure 1-16: Initial speed is smaller than the new speed

Figure 1-17: Initial speed is bigger than the new speed

Figure 1-18: The speed update is taken into account only if the second MLAxisAbs is triggered during acceleration or constant velocity

2.1.4.8.1.1 Output

Default (.Q)	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

```

2.1.4.12.5.2 Ladder Diagram

2.1.4.13.6.3 Function Block Diagram

2.1.4.14 MLAxisAdd

2.1.4.15.1 Description

A selected Axis performs a move for a specified distance relative to the endpoint of the previous move. The DeltaPosition input is signed so that the move can be in the positive or negative direction, and the Axis

moves this distance in user units. The travel speed, acceleration, deceleration, and User Units of the move are values inherited from the selected Axis. The default settings are entered when an Axis is created and initiated, and can be changed with other MLAxis commands such as [MLAxisGenWriteSpd](#), [MLAxisGenWriteAcc](#), and [MLAxisWriteUUnits](#).

2.1.4.16.2 Arguments

2.1.4.17.3.1 Input

ID	Description	ID Name of the Axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—
DeltaPosition	Description	Sets the Axis Delta Position to add to the endpoint of the previous move
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.4.18.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes, after the motion profile is complete
	Data type	BOOL
	Unit	n/a

2.1.4.60.9.2 Ladder Diagram

2.1.4.61.10.3 Function Block Diagram

2.1.4.62 MLAxisCreate

2.1.4.63.1 Description

Creates a new axis object. Returns the ID of the newly created axis object or 0 if the function failed

TIP

This function must be called or executed before "MLMotionStart" (→ p. 421) is called.

2.1.4.64.2 Arguments

2.1.4.65.3.1 Input

Name	Description	Default
Name	Description	Name of the created Axis
	Data type	STRING
	Range	—
	Unit	n/a
	Default	—
DriverName	Description	Is the Motion bus driver name or Simulated
	Data type	STRING
	Range	—
	Unit	n/a
	Default	—
Address	Description	Axis motion bus address
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—
ID	Description	ID name of the Axis Block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—

2.1.4.66.4.2 Output

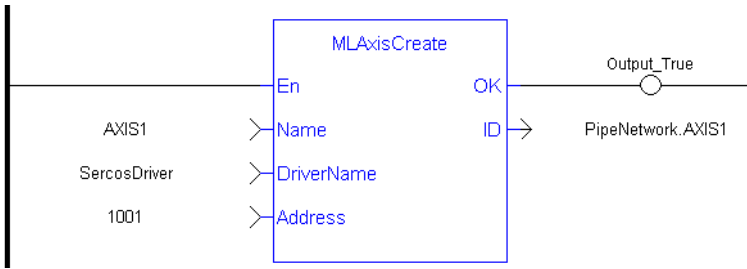

OK	Description	Default
	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

2.1.4.67.5 Example

2.1.4.68.6.1 Structured Text

```
MLAxisCreate( 'AXIS1', 'MSBusDriver', 1001);
```

2.1.4.71 MLAxisFBackPos

2.1.4.72.1 Description

Returns the Feedback Position of the axis

2.1.4.73.2 Arguments

2.1.4.74.3.1 Input

ID	Description	ID name of the Axis Block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—

2.1.4.75.4.2 Output

OK	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a
Position	Description	Returns the Feedback Position of the axis
	Data type	LREAL
	Unit	User unit

2.1.4.200.1 Description

Checks if the axis got a trigger event. Returns TRUE if the Fast Input event has been **triggered** and not yet been reset. MLAxisCfgFastIn

2.1.4.201.2 Arguments

2.1.4.202.3.1 Input

ID	Description	ID Name of the Axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—

InputID	Description	ID of the triggered Fast input of an axis (ie IN1 and IN2 on S300) 0 = Capture Engine 0 1 = Capture Engine 1 Range is [0,1] For information on configuring the capture engines, refer to AKD Capture Engine Configuration.
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—
edge	Description	Configures the Inputs as 0= Disabled, 1=Rising Edge, 2=Falling edge
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—

2.1.4.203.4.2 Output

2.1.4.251 MAxisRatedTq

2.1.4.252.1 Description

Allows conversion of drive torque values from rated torque units (1000=rated torque) to N.m (Newton meter).

2.1.4.253.2 Arguments

2.1.4.254.3.1 Input

ID	Description	Pipe network identifier of the axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—

Actual torque applied by the drive associated to the axis
 Rated torque = Peak Motor Current * Torque factor =
 MOTOR.IPEAK * MOTOR.KT

About SDO

MOTOR.IPEAK is obtained by SDO parameter: index 358Fh (sub-index 0)

MOTOR.KT is obtained by SDO parameter: index 3593h (sub-index 0)

For more details, refer to:

Torque	Description	<ul style="list-style-type: none"> • Communication SDOs • Manufacturer specific SDOs • Profile specific SDOs <p>To read/write an SDO object with an index greater than 16#7FFF (32767), the value must be entered in the form <code>any_to_int(index # in hex format)</code>. For example <code>any_to_int(16#8321)</code>.</p> <p>The actual units of MOTOR.IPEAK and MOTOR.KT are 1/1000 of the actual values if obtained by SDO. So the formula, if using the SDO values, is:</p> <p>Rated Torque = Torque = (SDO(MOTOR.IPEAK)/1000) * (SDO(MOTOR.KT)/1000)</p>
	Data type	LREAL
	Unit	N.m (Newton meter)

2.1.4.255.4.2 Output

2.1.4.357.9.3 Function Block Diagram

2.1.4.358 MLAxisReAlign

2.1.4.359.1 Description

When stopping the drive a motion profile is applied to decelerate. During the deceleration, the Reference position changes. Calling [MLAxisReAlign](#) realigns the actual position with the reference position by moving the axis by the specified delta position, which is typically calculated by the application code. After a [MLAxisStop](#) is executed, a [MLAxisReAlign](#) is required for the Pipe Position to be used again.

The function returns TRUE if it succeeds.

NOTE

The realign function do not work properly if the [MLAxisStop](#) function is continuously executed via its Start input

2.1.4.360.2 Arguments

2.1.4.361.3.1 Input

ID	Description	ID Name of the Axis block

2.1.4.367.9.3 Function Block Diagram

2.1.4.368 MLAxisRel

2.1.4.369.1 Description

A selected Axis performs a move for a specified distance relative to the current position. The DeltaPosition input is signed so that the move can be in the positive or negative direction, and the Axis moves this distance in user units. The travel speed, acceleration, deceleration, and User Units of the move are values inherited from the selected Axis. The default settings are entered when an Axis is created and initiated, and can be changed with other MLAxis commands such as [MLAxisGenWriteSpd](#), [MLAxisGenWriteAcc](#), and [MLAxisWriteJUUnits](#).

NOTE
If you wish to know when a move has completed, we recommend using [MLAxisGenIsRdy](#). The output of MLAxisRel can occur before moves have finished.

2.1.4.370.2 Arguments

2.1.4.371.3.1 Input

ID	Description	ID Name of the Axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—
DeltaPosition	Description	Sets the Axis Delta Position, or the relative distance to be moved
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.4.372.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes. This occurs immediately after the function is called; the function does not wait for the motion profile to be completed.
	Data type	BOOL

Unit n/a

```

2.1.4.405.7.2 Ladder Diagram

2.1.4.406.8.3 Function Block Diagram

2.1.4.407 MAxisStop

2.1.4.408.1 Description

Stop with the specified deceleration.

After stopping the drive, you need to restart the motion by realigning the actual position with the reference position

The purpose of the MLAxisStop Command is not to remove the input source, but to stop the drive from continuing to move.

When the stop occurs, the master keeps moving and the axis starts ignoring the Pipe Position value and begins a controlled stop based on the input parameters. Also at that point, any Axis Block level profile (issued from FB like MLAxisAbs, MLAxisRel...) are aborted. When the stop is complete, it is up to the application to decide how to move the axis, master, or both to a position where they can be realigned, and the master restarted.

The [realign](#) function is used to move the axis to a restart position in order to enable synchronized machine motion to start again. Once the realign function is successfully completed, the Pipe Position is again summed with the Generator Position to create the Reference Position.

2.1.4.409.2 Arguments

2.1.4.410.3.1 Input

ID	Description	ID Name of the Axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—
Start	Description	
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Deceleration	Description	
	Data type	LREAL
	Range	—
	Unit	User unit /sec ²
Default	—	

2.1.4.411.4.2 Output

Default (.Q)	Description	Comes true when the Axis is completely stopped.
	Data type	BOOL
	Unit	n/a
PipePos	Description	Corresponds to the Pipe Position input to the axis at the time the stop is triggered.
	Data type	LREAL
	Unit	User unit
GenPos	Description	Corresponds to the Generator Position input to the axis at the time the stop is triggered.
	Data type	LREAL
	Unit	User unit

RealignPos	<p>Description Realign Position is the Reference Position at which the stop is triggered. The Realign Position is obtained by converting the last value sent to the drive from drive interface units into user units.</p> <p>The Realign Position is useful if you want to return to the point at which the trajectory was abandoned, or in case you need to realign the master to the slave.</p>
	<p>Data type LREAL</p> <p>Unit User unit</p>
StopPos	<p>Description Corresponds to the last Reference Position sent to the drive at the time when the Axis is completely stopped. It is functionally different than the Actual Position because that position is the drive position converted to user units.</p> <p>The correct delta for the realign move to get in sync with the trajectory in order to realign the slave to the master is the current Reference Position minus the Stop Position for the realign move.</p> <p>After stopping, if the axis is disabled and the motor position is manually altered, this distance must be taken into account when performing the realign.</p>
	<p>Data type LREAL</p> <p>Unit User unit</p>

2.1.4.446 MLAxisWritePos

2.1.4.447.1 Description

Used to set a position offset at the Axis when the Pipe Network is not yet connected.

- Pipe Position and Pipe Offset are set to zero
- Generator Position is set to equal to Zero Position
- Then Reference Position equals Pipe Position + Generator Position

About associated data on Positions

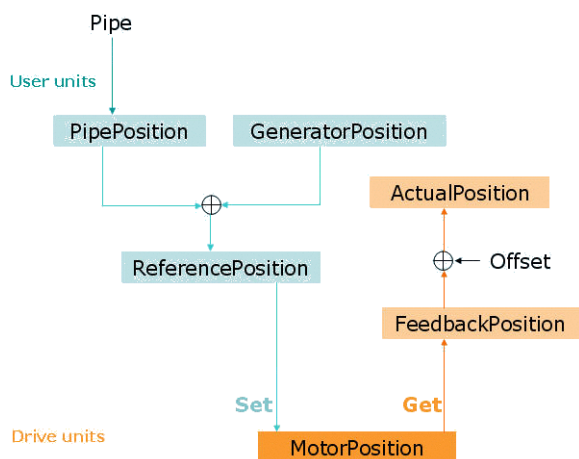

The following data are illustrated in the figure below.

NOTE

All positions are in user units with Modulo applied if active, unless specified.

Position / Offset	Description
ActualPosition	Actual refers to the actual position of the underlying Drive. It is the current position of the drive in user units. It is the sum of the feedback value (Position actual value) returned from the communication link to the drive, the Power ON Delta Offset , and any zero-offset due to an MLWritePos function ("MLAxisWritePipPos" (→ p. 160), "MLAxisWritePos" (→ p. 161)). Normally the value of power on delta offset is zero.
	$\text{ActualPos} := \text{FeedbackPos} + \text{ZeroOffset}$

Position / Offset	Description
CurrentPosition	<p>Current position is the actual command value being sent to the drive. It is an unsigned 32-bit integer value (fraction = zero). When in the power on condition this value is the command value that represents the target value in the communication link (Position demand value). It is not in user units, but in Drive units of 2^{20} units per revolution of the drive.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> $\text{CurrentPos} := \text{ReferencePosition} + \text{ZeroOffset}$ </div>
FeedbackPosition	<p>Feedback Position is the "Position actual value" read from the drive. FeedbackPos relates to the TxPDO value of 'Actual position value'</p>
GeneratorPosition	<p>Generator position is the summation of all previous commands to the Axis internal trapezoidal motion generator. It is also a collector of uncompensated motion due to "MLAxisWritePos" (→ p. 161)() being used to modify actual position via the zero offset value and the adjustment in commanded value to insure no steps in the Current position command. It also accumulates changes in pipe position due to activate and deactivation of the pipe and convertor output to pipe position of the axis.</p>
MotorPosition	<p>Motor position relates to the RxPDO value of 'Position demand value'</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> $\text{MotorPosition} = \text{CurrentPos} + \text{PowerOnDeltaOffset}$ </div>
PipePosition	<p>The output of the convertor block is written into the PipePosition value whenever the convertor block is connected to the axis and the pipe is active.</p>
Power ON Delta Offset	<p>A change was made a long time ago to allow absolute feedback to be passed into the axis rather than always starting at zero actual position. Units are in Drive units of 2^{20} units per revolution. On Drive Power On this value is set to be the difference between the "ActualPosition value" and the "Position demand value" last sent to the drive. It is then added to the Current position value when the "Position demand value" is updated. It is read in User Units without periodicity applied.</p>
ReferencePosition	<p>Reference position is the summation of PipePosition and GeneratorPosition.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> $\text{ReferencePosition} = \text{Pipe Position} + \text{Generator Position}$ </div>
Zero Offset	<p>Affected by the "MLAxisWritePos" (→ p. 161)() function to adjust the actual position to the desired value of the command by setting zero offset to the difference between the desired and actual position, and applying the change to modify the generator position so that the reference position tracks the change in reference.</p>

2.1.4.448.2 Arguments

2.1.4.449.3.1 Input

ID	Description	ID Name of the Axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—
Position	Description	Position offset.
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.4.450.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

2.1.4.451.5 Previous Function Name

MLAxisSetZero

2.1.4.452.6 Example**2.1.4.453.7.1 Structured Text**

```
MLAxisWritePos ( PipeNetwork.Axis1, 0 ) ;
```

2.1.4.454.8.2 Ladder Diagram**2.1.4.455.9.3 Function Block Diagram****2.1.4.456 MLAxisWriteUUnits****2.1.4.457.1 Description**

Set the user units per revolution value of the axis. Returns TRUE if the function succeeded. User units are user-defined position units used within the KAS application. Selected units must be as natural as possible and must make sense for the machine. It must be related to the final moving object (e.g. the driven belt rather than the axis shaft). The same unit must be used for all related axes for simplicity reasons. Speeds are defined in [user units / second] and accelerations in [user units / second²].

2.1.4.458.2 Arguments

2.1.4.459.3.1 Input

AxisID	Description	ID Name of the Axis block
	Data type	DINT
	Range	—
	Unit	n/a
	Default	—

2.1.4.460.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a
UserUnitsPerRev	Description	Sets the Axis User Units per revolution
	Data type	LREAL
	Unit	n/a

2.1.4.461.5 Example

2.1.4.462.6.1 Structured Text

```
MLAxisWriteUUnits (PipeNetwork.Axis1, 360 ) ;
```

2.1.4.464.8.3 Function Block Diagram

2.1.4.465 Usage Example of Axis Functions

MLAxisMoveVel(Speed) starts to run the axis. Then **MLAxisGenIsRdy** returns TRUE when the Speed is reached.

MLAxisMoveVel(0.0) reduces the speed down to 0. Then **MLAxisGenIsRdy** returns TRUE once the axis is ready.

Figure 1-19: Axis Functions Usage

2.1.5 Motion Library - Cam Profile

Name	Description	Return type
"MLCamInit" (→ p. 166)	Initializes a cam Pipe Block with user-defined settings	BOOL
"MLCamSwitch" (→ p. 168)	Switches profiles of the selected cam object	BOOL

Name	Description	Return type
"MLPrfReadIOffset" (→ p. 169)	Returns the Input Offset value of a selected cam profile	None
"MLPrfReadIScale" (→ p. 170)	Returns the Input Ratio value of a selected cam profile	None
"MLPrfReadOOffset" (→ p. 171)	Returns the Output Offset value of a selected cam profile	None
"MLPrfReadOScale" (→ p. 173)	Returns the Output Ratio value of a selected cam profile	None
"MLPrfWriteIOffset" (→ p. 174)	Sets the Input Offset value of a selected cam profile	BOOL
"MLPrfWriteIScale" (→ p. 175)	Sets the Input Ratio value of a selected cam profile	BOOL
"MLPrfWriteOOffset" (→ p. 177)	Sets the Output Offset value of a selected cam profile	BOOL
"MLPrfWriteOScale" (→ p. 178)	Sets the Output Ratio value of a selected cam profile	BOOL
"MLProfileBuild" (→ p. 408)	Builds a cam profile from application data	See "Output" (→ p. 410)
"MLProfileCreate" (→ p. 413)	Creates a new cam profile object	None
"MLProfileInit" (→ p. 414)	Initializes a previously created cam profile object	BOOL
"MLProfileRelease" (→ p. 416)	Removes a Profile so the Profile ID may be used by a different or new Profile.	See "Output" (→ p. 417)

2.1.5.1 MLCamInit

2.1.5.2.1 Description

Initializes a Cam Pipe Block for use in a PLC Program. Function block is automatically called if a Cam Block is added to the Pipe Network, with user-defined settings then entered in the Pipe Blocks Properties screen.

The Cam Pipe Block is used to generate motion profiles of any shape. These profiles are created and initiated separately and the shape is modified with the Cam Editor. With the Editor profiles can be changed graphically or by manually changing values in a numeric table relating input and output values with specific slopes. The Cam Editor software tool provides the capability to visualize, analyze, edit, and smooth profiles.

With the PipeNetwork (PN) Cam block:

- the Cam block's profile is in reference to the input positions coming into the PN Cam block (Master Absolute)
- the PN Cam block output positions are in reference to PN Cam block's output position at the end of the last cam cycle (Slave Relative)

Profile switching can be done on the fly, without losing synchronization and without dead time. In addition, the offsets and ratios of Cam Profiles can be changed on the fly. See Cam Profile Switching for more information.

NOTE

CAM objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLCamInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.5.3.2 Arguments

2.1.5.4.3.1 Input

BlockID	Description	ID number of a created Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	CAM
ProfileName	Description	Name of the current profile assigned to the cam. It must be a declared profile object
	Data type	STRING
	Range	—
	Unit	n/a
	Default	—
ModuloPosition	Description	Value of the period of the cam output values expressed in user units, for a cyclic system
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	360.0

2.1.5.4.2 Output

Default (.Q)	Description	Returns TRUE if the CAM Pipe Block is initialized
	Data type	BOOL
	Unit	n/a

2.1.5.6.5.3 Return Type

BOOL

MLCamInit( CAM, 'Profile_A', 360.0 );
```

2.1.5.10.9.2 Ladder Diagram

2.1.5.11.10.3 Function Block Diagram

2.1.5.12 MLCamSwitch

2.1.5.13.1 Description

Switches the CAM Profile in a selected CAM object. Can be used in combination with a comparator to check that profiles are switched at a time where the input and output values of both the old and new profiles are equal, so an Axis receives continuous position values and does not jump.

These profiles are created and initiated separately and the shape is created with the CAM Editor. With the Editor profiles can be changed graphically or by manually changing values in a numeric table relating input and output values with specific slopes. The Cam Editor software tool provides the capability to visualize, analyze, edit, and smooth profiles.

See Cam Profile Switching for more information.

2.1.5.14.2 Arguments

2.1.5.15.3.1 Input

Argument	Description	Value
BlockID	Description	ID number of an initialized CAM Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
ProfileID	Description	Name of the new CAM profile which is assigned to the CAM Pipe Block. It must be a declared profile object.
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.5.16.4.2 Output

Argument	Description	Value
Default (.Q)	Description	Returns TRUE if the CAM Profile is changed
	Data type	BOOL
	Unit	n/a

2.1.5.17.5.3 Return Type

BOOL

2.1.6.11.10.3 Function Block Diagram

2.1.6.12 MLComplnit

2.1.6.13.1 Description

Initializes a comparator Pipe Block for use in a PLC Program. Function block is automatically called if a Comparator Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Transition Flag of a comparator object turns TRUE if the input position to the comparator is greater or equal to the reference. The Comparator Transition Flag stays TRUE until it is reset.

If the input ThroughZero is set to TRUE, system must cross zero and then the reference position before the Transition Flag is set. If ThroughZero is FALSE, Transition Flag is set immediately if the input pipe position is greater or equal to the Reference value.

NOTE

Comparator objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLComplnit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.6.14.2 Arguments

2.1.6.44 MLCompWriteRef

2.1.6.45.1 Description

Set the reference position of a comparator block. The Transition Flag of a comparator object turns TRUE if the input position to the comparator is greater or equal to the reference. The Comparator Transition Flag stays TRUE until it is reset.

If the input ThroughZero is set to TRUE, system must cross zero and then the reference position before the Transition Flag is set. If ThroughZero is FALSE, Transition Flag is set immediately if the input pipe position is greater then or equal to the Reference value.

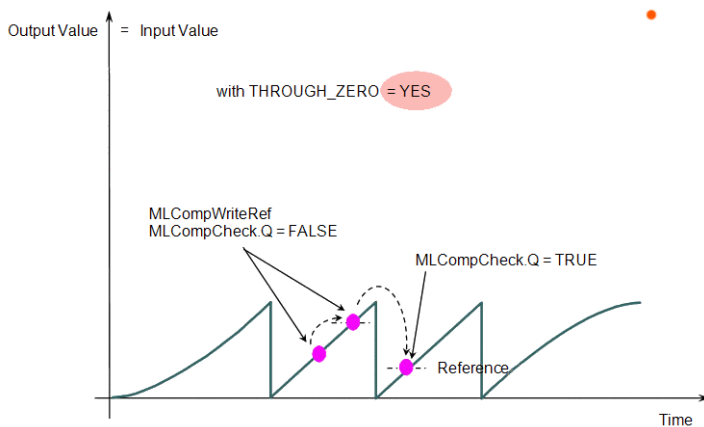

Figure 1-29: MLCompWriteRef

2.1.6.46.2 Arguments

2.1.6.47.3.1 Input

BlockID	Description	ID number of an initiated Comparator object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

ThroughZero	Description	When TRUE, system must cross zero and then the reference position before the Transition Flag is set. If FALSE, Transition Flag is set immediately if the input pipe position is greater then or equal to the Reference value.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Reference	Description	New reference position to set in the selected Comparator object
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.6.48.4.2 Output

Default (.Q)	Description	Returns TRUE when function starts to execute
	Data type	BOOL

//Set the Comparator Reference value
MLCompWriteRef( PipeNetwork.MyComp , TRUE , 45 );
```

2.1.6.53.9.2 Ladder Diagram

2.1.6.54.10.3 Function Block Diagram

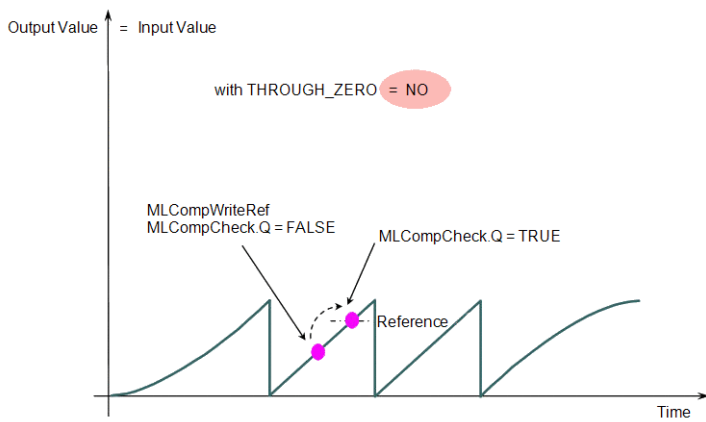

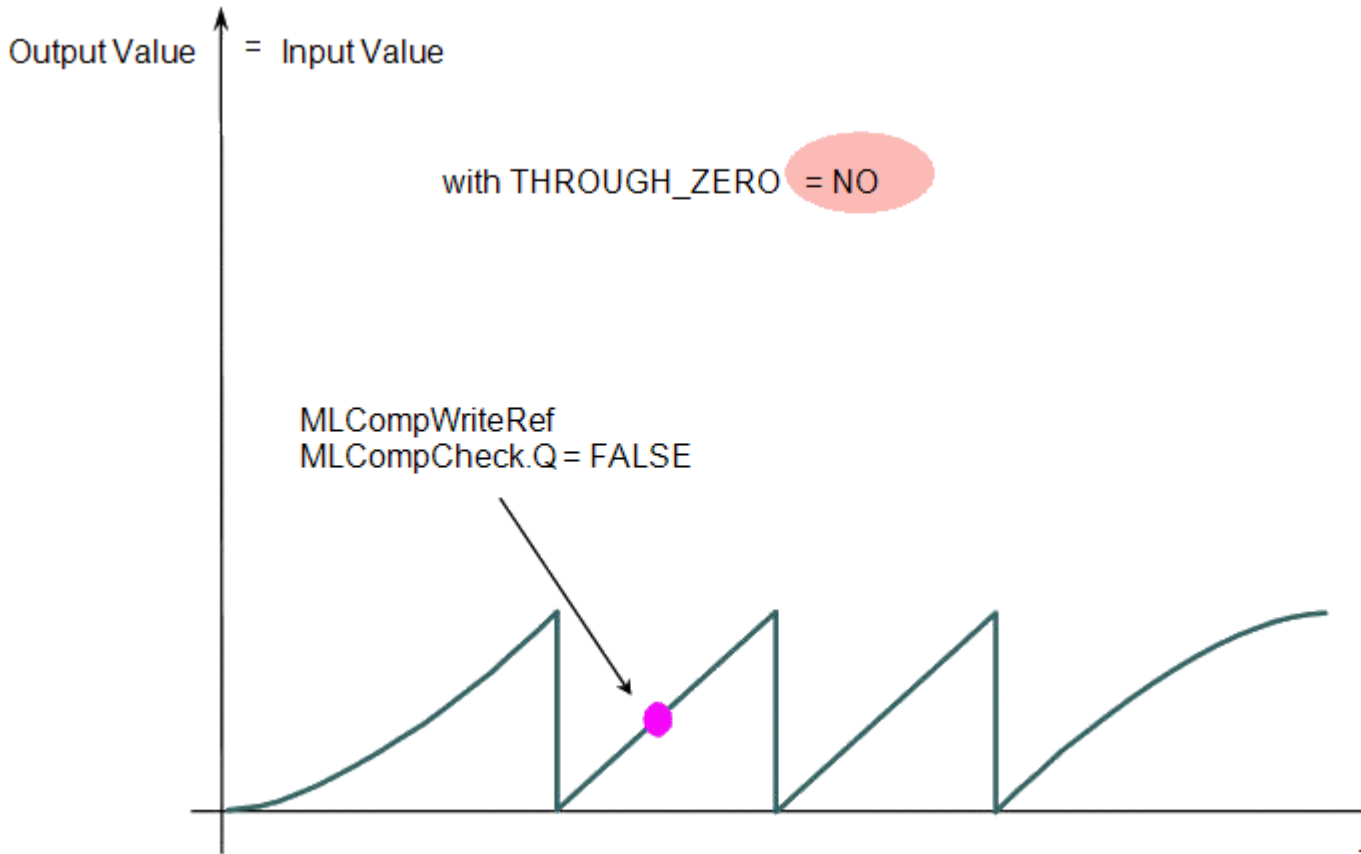

2.1.6.55 Usage example of Comparator Functions

When you call the **MLCompWriteRef** function, the output for MLCompCheck becomes True as soon as the input value reaches the reference.

The same function can also be called for a cyclic input value.

When the THROUGH_ZERO parameter is set to YES, the output for MLCompCheck becomes True as soon as the input value reaches the reference, but not before it has passed through zero.

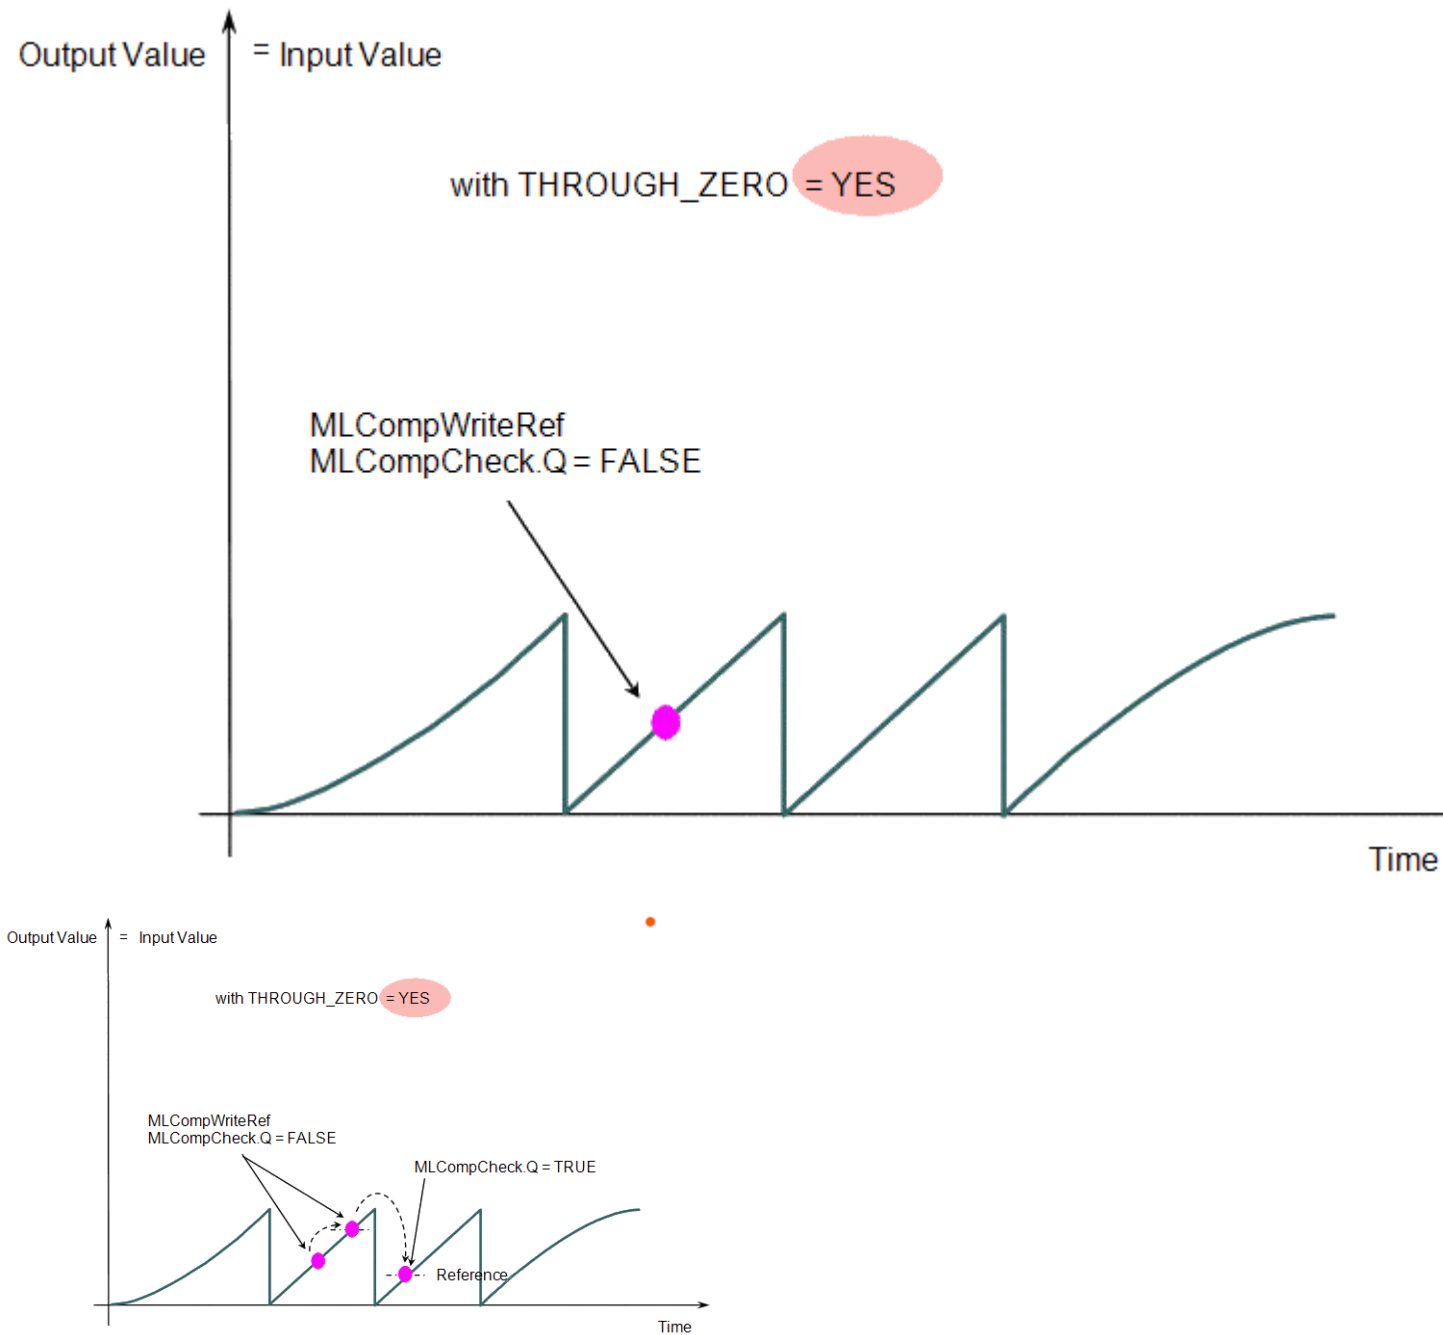

Figure 1-30: Comparator Functions Usage

2.1.7 Motion Library - Convertor

Name	Description	Return type
"MLCNVConnect" (→ p. 191)	Connects a converter Pipe Block to the specified axis	BOOL
"MLCNVConnectEx" (→ p. 192)	Connects an extra converter Pipe Block to the specified axis. This function connects the output of a pipe to an axis data other than the control position.	BOOL
"MLCNVDisconnect" (→ p. 196)	Disconnects a converter Pipe Block from its associated axis	BOOL

Name	Description	Return type
"MLCNVInit" (→ p. 197)	Initializes a converter Pipe Block in Position or Speed mode	BOOL

2.1.7.1 MLCNVConnect

2.1.7.2.1 Description

Connect a converter Pipe Block to the specified axis. When using the Pipe Network for coordinated motion, Pipe Blocks have to be Activated, Connected, and then Powered On before move commands work.

The Converter block changes the incoming flow of values to continuous position output with no periodicity. If a converter block is not connected to an Axis, it does not send position output values to its assigned Axis. Every pipe branch must end in a converter, whether or not it is connected to a destination Axis object, as seen in Figure 1 below.

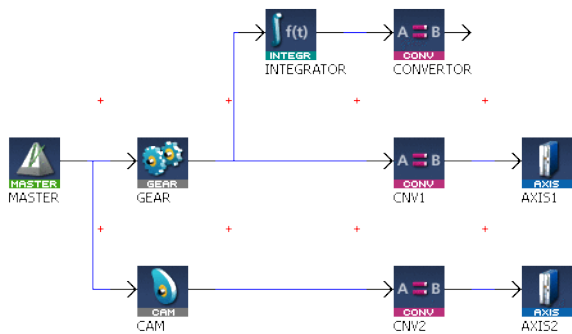

Figure 1-31: MLCNVConnect

NOTE

All converters in the Pipe Network can be connected at once with the command PipeNetwork(MLPN_Connect). This calls automatically generated code with MLCNVConnect commands for each Converter block. Therefore, in a multi-axis program only one command can be used to connect Pipe Blocks instead of writing code for each Axis separately.

TIP

The converter block has the ability to control the analog output on the AKD. See for information on the parameters.

2.1.7.3.2 Arguments

2.1.7.4.3.1 Input

BlockID	Description	ID number of an initiated Converter object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
AxisID	Description	ID number of an initiated Axis object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.7.5.4.2 Output

Default (.Q)	Description	Returns TRUE if the converter is connected to the Axis object
	Data type	BOOL
	Unit	n/a

2.1.7.6.5.3 Return Type

BOOL

2.1.7.7.6 Related Functions

"MLCNVConnectEx" (→ p. 192)

"MLCNVDisconnect" (→ p. 196)

"MLCNVInit" (→ p. 197)

2.1.7.8.7 Example

2.1.7.9.8.1 Structured Text

```
//Connect a converter Pipe Block to Axis1
MLCNVConnect ( PipeNetwork.CNV1, AXIS1 );
```

2.1.7.10.9.2 Ladder Diagram

2.1.7.11.10.3 Function Block Diagram

2.1.7.12 MLCNVConnectEx

2.1.7.13.1 Description

Connect a converter Pipe Block to the specified axis. This function connects the output of a pipe to an axis data other than the control position. With this function, several converter Pipe Blocks can connect to the same axis and acts on different data.

Normally a Converter block sends position values to an Axis. However, some cases exist that require additional information such as torque feed-forward (IDN 3056) that needs to be provided by a second converter.

NOTE
This FB does not work when you choose to [simulate](#) the device. In such a case, the FB continuously generates error messages displayed in the Controller log window.

NOTE
Need to add 16#8000 to desired IDN number for ValueID input. 8000 in hexadecimal signals a vendor-specific IDN value.

2.1.7.14.2 Arguments

2.1.7.15.3.1 Input

BlockID	Description	ID number of an initiated Converter object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
AxisID	Description	ID number of an initiated Axis object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ValueID	Description	Specify the following constant: <ul style="list-style-type: none"> • EC_ADDITIVE_TORQUE_VALUE (for torque feed-forward) • EC_ANALOG_OUTPUT (for control of Analog Output: AKD parameter: "AOUT.VALUEU") <p>If the Analog Output is mapped to a PLC variable, the connection to the analog output by EC_ANALOG_OUTPUT will not work as the output value will be overwritten by the PLC mapped variable data. In order to function properly the AOUT.MODE must be set to "User Mode (mode = 0)".</p> <p>See the TIP below for more information.</p>
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ValueInfo	Description	This value is ignored and must be set to zero
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

TIP

The PDO values will be overwritten by Mapped PLC variables including a possible link to the mapping of variables or the section on `MLParamWrite()` warning indicating that the function block write of Analog output will be overwritten by the `MLCnvConnectEx` function.

Precedence rules:

1. A PLC variable mapped to Analog Output takes precedence.
2. If `MLCnvConnect` assigns a Pipe output to Analog Output it will take precedence over a `DriveParamWrite` function call.
3. `DriveParamWrite` will modify the Analog Output but get overwritten by the higher precedent options if they are present.

2.1.7.16.4.2 Output

Default (.Q)	Description	Returns TRUE if the converter is connected to the Axis object
	Data type	BOOL

Unit n/a

2.1.7.17.5.3 Return Type

BOOL

2.1.7.22.10.3 Function Block Diagram

2.1.7.23 MLCNVConECAT

2.1.7.24.1 Description

This function will connect the output of a pipe convertor block to an EtherCAT Output (Rx) PDO object. The output value of the convertor block will then be written to the PDO object every update of the convertor block. The pipe block is specified by the BlockID input and the PDO object is specified by the DeviceAddr, Index, and SubIndex inputs.

2.1.7.25.2 Arguments

2.1.7.26.3.1 Input

BlockID	Description
	The convertor block whose output value will be written to the PDO object. For example: PipeNetwork:CNV1
	Data type DINT
	Range n/a

	Unit	n/a
	Default	—
DeviceAddr	Description	The device address of the PDO object to be written. EtherCAT devices are numbered in order with the first device being 1001, the second 1002, etc.
	Data type	INT
	Range	n/a
	Unit	n/a
	Default	—
Index	Description	The index of the PDO object to be written. The index can be determined from the table located in the “PDO Selection/Mapping” tab of the EtherCAT device page. (In Project Explorer, under EtherCAT, select the device, then select the PDO Selection/Mapping tab.)
	Data type	UINT
	Range	n/a
	Unit	n/a
	Default	—
SubIndex	Description	The sub index of the PDO object to be written. The sub index can be determined from the table located in the “PDO Selection/Mapping” tab of the EtherCAT device page. (In Project Explorer, under EtherCAT, select the device, then select the PDO Selection/Mapping tab.)
	Data type	USINT
	Range	n/a
	Unit	n/a
	Default	—

2.1.7.27.4.2 Output

Default (.Q)	Description	Returns TRUE if this function has successfully connected the output of the pipe convertor block to the EtherCAT Output (Rx) PDO Object.
	Data type	BOOL
	Unit	n/a

```
//Connect a converter Pipe Block to Axis1
MLCNVConECAT( PipeNetwork.CNV2(*DINT*), 1002(*INT*), 16#60B2(*UINT), 0
(*USINT*) );
```

2.1.7.31.8.2 Ladder Diagram

2.1.7.32.9.3 Function Block Diagram

2.1.7.33 MLCNVDisconnect

2.1.7.34.1 Description

Disconnect a converter Pipe Block from its associated axis.

If a converter block is not connected to an Axis, it does not send position output values to its assigned Axis. Can disconnect one or multiple Axis from the Pipe Network and still send single-axis motion commands. Axis can be disconnected while the Pipe Positions are reset to different values or if coordinated motion is only not needed with every axis in the project in a certain state.

2.1.7.35.2 Arguments

2.1.7.36.3.1 Input

BlockID	Description	ID number of an initiated Converter object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.7.37.4.2 Output

Default (.Q)	Description	Returns TRUE if the converter is disconnected from the Axis object
	Data type	BOOL
	Unit	n/a

2.1.7.38.5.3 Return Type

BOOL

2.1.7.39.6 Related Functions

2.1.7.43.10.3 Function Block Diagram

2.1.7.44 MLCNVInit

2.1.7.45.1 Description

Initializes a converter Pipe Block. Function block is automatically called if a Converter Block is added to the Pipe Network, with the input mode (position or speed) entered in the Pipe Blocks Properties screen. The Converter block changes the incoming flow of speed or position values to continuous position output with no periodicity.

NOTE

Converter objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLCNVInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.7.46.2 Arguments

2.1.7.47.3.1 Input

BlockID	Description	ID number of a created Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Mode	Description	1 for Position mode, 2 for Speed mode. Determines the type of input to the Converter Object.
	Data type	DINT
	Range	[1, 2]
	Unit	n/a
	Default	—

2.1.7.48.4.2 Output

Default (.Q)	Description	Returns TRUE if the Converter Pipe Block is initialized
	Data type	BOOL
	Unit	n/a

2.1.9.11.10.3 Function Block Diagram

2.1.9.12 MlDerReadInModPos

2.1.9.13.1 Description

Returns the Input ModuloPosition of the derivator block. Input ModuloPosition is defined to manage the periodicity (modulo) of the input values.

For example, if the input value increases each millisecond by one degree then the output value is 1000 degrees per second. Now lets imagine that the input value skips suddenly from 359 to 0

- If Input ModuloPosition = 360, the output continues to indicate 1000 degrees per second, indicating that rollover into the next period has been properly handled

- If Input ModuloPosition = 1000, the output then indicates 359,000 degrees per second, indicating that the input has incorrectly interpreted roll-over as a 359 degree move in one millisecond

Figure 1-33: MlDerReadInModPos

NOTE

The first calculation of a Derivator Pipe Block just after the pipe installation indicates zero regardless of the initial input value.

2.1.9.14.2 Arguments

2.1.9.15.3.1 Input

ID	Description	ID number of an initiated Derivator object
	Data type	DINT

2.1.10 Motion Library - Gear

Name	Description	Return type
"MLGearInit" (→ p. 206)	Initializes a Gear Pipe Block with user-defined settings	BOOL
"MLGearReadOffset" (→ p. 209)	Returns the offset value of selected Gear Block	None
"MLGearReadOffSlp" (→ p. 210)	Returns the Offset Slope value of selected Gear Block	None
"MLGearReadRatio" (→ p. 211)	Returns the ratio value of a gear block	None
"MLGearReadRatSlp" (→ p. 212)	Returns the ratio slope value of a gear block	None
"MLGearWriteOff" (→ p. 213)	Sets the Offset value of a selected Gear Pipe Block	BOOL
"MLGearWriteOSlp" (→ p. 214)	Sets the Offset Slope value of a selected Gear Pipe Block	BOOL
"MLGearWriteRatio" (→ p. 216)	Sets the Ratio value of a selected Gear Pipe Block	BOOL
"MLGearWriteRatSlp" (→ p. 217)	Sets the Ratio Slope value of a selected Gear Pipe Block	BOOL

2.1.10.1 Usage example of Gear Functions

The output value starts with offset = 0 and gain = 1 (blue line)

You can call the **MLGearWriteOff** function to modify the Offset (where Offset_Slope is set with the **MLGearWriteOSIp** function).

After setting the Offset (Q=TRUE in the previous figure), you can call the **MLGearWriteRatio** function to modify the gear Ratio (where Gain_Slope is set with the **MLGearWriteRatSIp** function).

The output value is finally adapted with the gear offset and ratio (blue line).

Figure 1-35: Gear Functions Usage

2.1.10.2 MLGearInit

2.1.10.3.1 Description

Initializes a Gear Pipe Block for use in a PLC Program. Function block is automatically called if a Gear Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Pipe Block is assigned a Name, Ratio, Offset, and Slopes for changes in Ratio and Offset values. You can also choose between Modulo or Not modulo mode. Slopes set the limit at which step changes in Ratio and Offset are implemented. The default slope value when creating a Gear Block is Max or infinite.

The output of a Gear Block = Input value * Ratio + Offset

NOTE

Be sure to set $\text{RatioSlope} < (\text{Ratio} * \text{EtherCAT Update Rate})$. The Gear block will make a jump (without a ramp) from one gear to the next when the RatioSlope is greater than the Ratio change factor multiplied by the update rate scale factor.

TIP

Gear objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLGearInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.10.4.2 Arguments**2.1.10.5.3.1 Input**

BlockID	Description	ID number of a created Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	GEAR
Ratio	Description	Ratio of new Gear Pipe Block. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	1.0
Offset	Description	Offset of new Gear Pipe Block. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	0.0
UseUserRatioSlope	Description	FALSE to use default MAX or Infinite Slope, TRUE to use user-defined RatioSlope
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	FALSE
RatioSlope	Description	User-defined limit at which step changes in Ratio are implemented. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	1/sec
	Default	0.0
UseUserOffsetSlope	Description	FALSE to use default MAX or Infinite Slope, TRUE to use user-defined OffsetSlope

	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	FALSE
OffsetSlope	Description	User-defined limit at which step changes in Offset are implemented. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	0.0
Modulo	Description	TRUE when mode is modulo. Modulo mode adapts the output values according to the ModuloPosition (modulo)
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	FALSE
Offset	Description	Offset of new Gear Pipe Block. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	0.0
RatioSlope	Description	User-defined limit at which step changes in Ratio are implemented. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	1/sec
	Default	0.0

2.1.10.6.4.2 Output

Default (.Q)	Description	Returns TRUE if the Gear Pipe Block is initialized
	Data type	BOOL
	Unit	n/a

2.1.10.7.5.3 Return Type

BOOL

2.1.10.85.10.3 Function Block Diagram

2.1.10.86 MLGearWriteRatSlp

2.1.10.87.1 Description

Set the Ratio Slope value of a selected Gear Pipe Block. Ratio Slope sets the limit at which step changes in ratio are implemented. The default value when creating a Gear Block is RATIO_SLOPE_MAX or infinite.

NOTE

Be sure to set $\text{RatioSlope} < (\text{Ratio} * \text{EtherCAT Update Rate})$. The Gear block will make a jump (without a ramp) from one gear to the next when the RatioSlope is greater than the Ratio change factor multiplied by the update rate scale factor.

TIP

Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)

NOTE

The GEAR block output will add a position offset to the GEAR block input when using a RatioSlope. See "RatioSlope Offset" (→ p. 218) in the Examples below.

2.1.10.88.2 Arguments

2.1.10.89.3.1 Input

BlockID	Description	ID number of an initialized Gear Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Slope	Description	New Ratio Slope value to be assigned to selected Gear Pipe Block. Values lower than 1.0 can be entered, but require a leading zero (for example 0.8 instead of .8)
	Data type	LREAL
	Range	—
	Unit	1/sec
	Default	—

2.1.10.90.4.2 Output

Default (.Q)	Description	Returns TRUE if Ratio Slope value is changed in the selected Gear Pipe Block
---------------------	--------------------	--

Data type BOOL
Unit n/a

2.1.10.91.5.3 Return Type

BOOL

2.1.10.92.6 Related Functions

"MLGearReadOffSlp" (→ p. 210)

"MLGearInit" (→ p. 206)

2.1.10.93.7 Example

2.1.10.94.8.1 Structured Text

```
//Set the Ratio Slope value of Gear1 Pipe Block to 100
MLGearWriteRatSlp(PipeNetwork.GEAR1, 100.0);
```

2.1.10.95.9.2 Ladder Diagram

2.1.10.96.10.3 Function Block Diagram

2.1.10.97.11.4 RatioSlope Offset

If MLGearWriteRatSlp is set as `MLGearWriteRatSlp(PipeNetwork.GEAR1 12 , Gear1RatioSlope 500.0);` to generate a ramp (instead of a step) when going from a gear ratio of 1 to 2, then there will be a position offset when the gear ratio settles as 2. In the image below the ratio goes from 1.0 to 2.0; Green is PN Gear Block Output and Red is Gearbox Input.

1. Green line: PN Gear Block Output
2. Red line: PN Gearbox Input
3. When the ratio is changed
4. Phase difference

If MLGearWriteRatSlp is set without a ramp,

```
MLGearWriteRatSlp( PipeNetwork.GEAR1 12 , Gear1RatioSlope 1e+301 );
```

, then there will not be an offset.

1. Green line: PN Gear Block Output
2. Red line: PN Gearbox Input
3. When the ratio changes
4. Synched

2.1.11 Motion Library - Integrator

Name	Description	Return type
MLIntInit	Initializes an integrator object	BOOL
MLIntWriteOutVal	Sets the output value of an integrator object	BOOL

2.1.11.1 MLIntInit

2.1.11.2.1 Description

Initializes an integrator object. Function block is automatically called if an Integrator Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

Integrator object can operate in Modulo or not modulo mode. While in Modulo mode, the output values are adapted according to the entered ModuloPosition value.

Figure 1-36: MLIntInit

NOTE

Integrator objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLIntInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.11.3.2 Arguments

2.1.11.4.3.1 Input

BlockID	Description	ID number of a created Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ModuloPosition	Description	Output ModuloPosition of Integrator object

Data type	LREAL
Range	—
Unit	User unit
Default	360.0

Modulo	Description	TRUE when mode is modulo. Modulo mode adapts the output values according to the ModuloPosition (modulo)
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	TRUE

2.1.11.5.4.2 Output

Default (.Q)	Description	Returns TRUE if the Integrator object is initialized
	Data type	BOOL
	Unit	n/a

2.1.11.6.5.3 Return Type

BOOL

2.1.12 Motion Library - Master

TIP

- For an example of Master Functions, see "Usage example of Master Functions" (→ p. 242)

Function sorted by types:

Motion Control	Inquiry Functions	Position setting
MLMstInit	MLMstReadAccel	MLMstAbs
MLMstRun	MLMstReadDecel	MLMstAdd
MLMstWriteAccel	MLMstReadInitPos	MLMstForcePos
MLMstWriteDecel	MLMstReadSpeed	MLMstRel
MLMstWriteSpeed	MLMstStatus	

Functions sorted in alphabetical order:

Name	Description	Return type
MLMstAbs	Does an absolute move	BOOL
MLMstAdd	Does an additive move relative for a specified distance from the endpoint of the previous move	BOOL
MLMstForcePos	Forces the specified position. Possible only when the block is not moving.	BOOL
MLMstInit	Initializes a master object (TMP generator)	BOOL
MLMstReadAccel	Gets the present acceleration value of a master block	None
MLMstReadDecel	Gets the present deceleration value of a master block	None
MLMstReadInitPos	Gets the initial position of a master block	None
MLMstReadSpeed	Gets the speed of a master block	None
MLMstRel	Does an Relative move for a specified distance from the current position	BOOL
MLMstRun	Jogs at the specified speed. Returns TRUE if the function succeeded	BOOL
MLMstStatus	Returns the status of the generator	DINT
MLMstWriteAccel	Sets the acceleration of a master block	BOOL
MLMstWriteDecel	Sets the deceleration of a master block	BOOL
MLMstWriteInitPos	Sets the initial position of a master block	BOOL
MLMstWriteSpeed	Sets the speed of a master block	BOOL

2.1.12.1 MLMstAbs

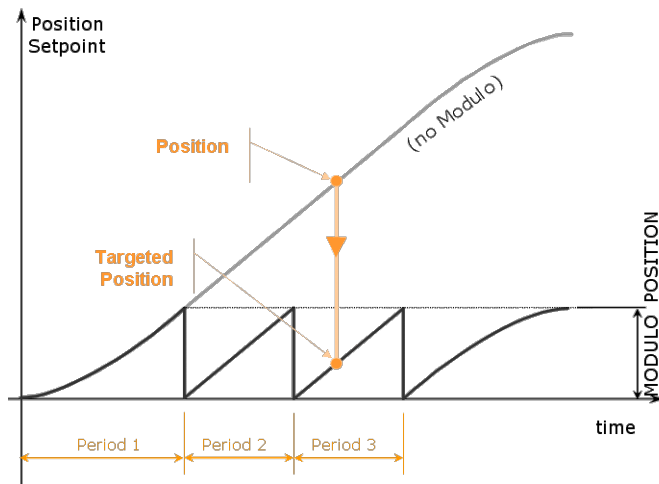

2.1.12.2.1 Description

Performs a move to an absolute position. Returns TRUE if the function succeeded.

2.1.12.3.2 Arguments

2.1.12.4.3.1 Input

BlockID	Description	ID name of the Master Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Position	Description	Sets the value of the absolute destination position. When the Modulo is turned on, the Master Block moves to the targeted position during the corresponding period, calculated as follows: <ul style="list-style-type: none"> • If the Position input is between 0 and the Modulo Position, then the Master Block moves within the current period (no position rollover). • If the Position input is greater than the Modulo Position, then the Master Block moves during one of the next period (positive position rollover).

The Master Block works similarly for negative positions: if the Position input is less than zero, then the Master Block moves during one of the **previous** period (negative position rollover).

Data type	LREAL
Range	—
Unit	User unit
Default	—

2.1.12.5.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

2.1.12.30.9.3 Function Block Diagram

2.1.12.31 MLMstInit

2.1.12.32.1 Description

Initializes a Master TMP (trapezoidal motion profile) generator block. This function is automatically created when the MLMaster Block is included in the Pipe Network Editor. Based on the parameters defined in the [Master](#) pipe block (see figure below), the Inputs for this function are initialized by default.

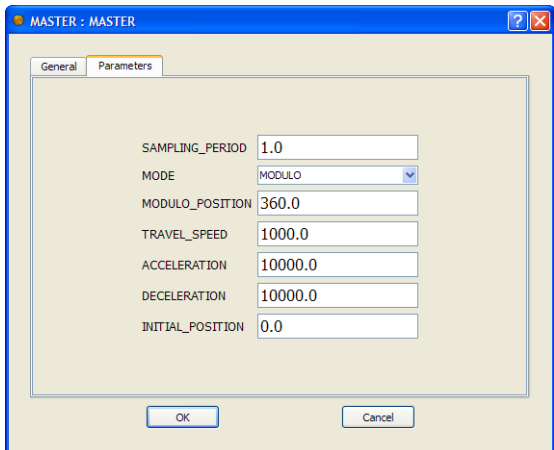

Figure 1-37: TMP Initialization

2.1.12.33.2 Arguments

2.1.12.34.3.1 Input

Block ID	Description	ID name of the Master Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ModuloPosition	Description	Modulo Position for cyclic motion systems expressed in user logical units (Position Rollover Value)
	Data type	LREAL
	Range	—
	Unit	User unit
Period	Description	Sampling period of the generator expressed according to the update cycle (e.g. 2.0 means the sampling is done once every 2 cycles)
	Data type	LREAL
	Range	—
	Unit	User unit
Speed	Description	Travel speed value expressed in user logical units per second. The travel speed value is used to set the constant speed part of the trapezoidal motion profile
	Data type	LREAL
	Range	—
	Unit	User unit sec

	Default	—
Acceleration	Description	Acceleration value expressed in user logical units per second squared. The acceleration value is always used to generate the first part of the trapezoidal motion profile
	Data type	LREAL
	Range	—
	Unit	User unit /sec ²
	Default	—
Deceleration	Description	Deceleration value expressed in user logical units per second squared. The deceleration value is always used to generate the last part of the trapezoidal motion profile
	Data type	LREAL
	Range	—
	Unit	User unit /sec ²
	Default	—
Initial Position	Description	Initial position value expressed in user logical units. Used only at the pipe activation to initialize the position starting point
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—
Modulo	Description	The available modes are Modulo (True) or No modulo (False)
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

2.1.12.35.4.2 Output

2.1.12.98 MLMstStatus

2.1.12.99.1 Description

The value returned is the state being executed by the TMP generator as it processes the various motion commands. Some states are transitory, others are stable until the next event takes place. The following terms are relevant to the returned values.

Term	Definition
Running	Speed is non-zero
Stopped	Speed is zero
Positioning	A target position has been programmed with a relative, additive or absolute command.
Status	Definition
0	(New speed programmed) is entered when a jog move (MLMstRun) is commanded and the current speed is not at the commanded speed.
1	(Stable state Running or Stopped) is entered when a jog move (MLMstRun) is commanded and the current speed is at the commanded speed. (Stable state Running or Stopped) is entered when a position move is programmed and motion is completed.
2	(Speed change) is entered when the current speed is greater than the commanded speed.
3	(Speed reversal while positioning) is entered when a position move is programmed and the distance to go requires a speed reversal.
4	(Acceleration while positioning) current speed is below the travel speed
5	(Constant Speed while positioning) is entered when a positioning move is commanded and the current speed is at the commanded speed.
6	(Deceleration while positioning) is entered when a positioning move is commanded and the current speed is changing to achieve the target position at zero speed.
7	(Micro step) is entered when a small change in position is required and the current speed is zero.

2.1.12.146 Usage example of Master Functions

MLMstRun(0.0) reduce the speed down to 0.

Figure 1-38: Master Functions Usage

2.1.13 Motion Library - Phaser

TIP

- For an example of Phaser functions, see "Usage example of Phaser Functions" (→ p. 243)

Names	Description	Return type
"MLPhalnit" (→ p. 244)	Initializes a phaser Pipe Block	BOOL
"MLPhaReadPhase" (→ p. 247)	Gets the phase value of a phaser block	None
"MLPhaReadSlope" (→ p. 248)	Gets the phase slope value of a phaser block	None
"MLPhaWritePhase" (→ p. 248)	Sets the phase value of a phaser block	BOOL

Names	Description	Return type
"MLPhaWriteSlope" (→ p. 249)	Sets the phase slope value of a phaser block	BOOL
"MLPhaReadActPhase" (→ p. 246)	Get the actual phase value of a phaser block.	LREAL

TIP

There is a delay when using an external encoder. The delay is five cycles (2 cycles to read the encoder from the AKD via EtherCAT, 1 cycle for computing, 2 cycles for sending the new position set point to the AKD). This lag error is speed proportional (5 cycles * speed). A Phaser block can be used to compensate for this lag.

When executing, the phaser block is in one of three states: **Standby**, **Changing phase**, or **Applying phase**.

Standby	Entered when the Block is initialized. Exits to the State "Changing Phase" when the Phase value is changed via the "MLPhaWritePhase" (→ p. 248) command
Changing Phase	Entered when a new value is programmed, and exits to "Applying phase" state when the programmed phase offset is reached. The current Phase offset value is slewed to the new phase offset by the amount of the slew value.
Applying Phase	Entered when the programmed Phase value is reached. Exits to the Changing phase state whenever a new value is programmed via the "MLPhaWritePhase" (→ p. 248) function changes the Phase Offset target.

2.1.13.1 Usage example of Phaser Functions

You can call "MLPhaWritePhase" (→ p. 248) function to modify the Phase value..

You can call "MLPhaWriteSlope" (→ p. 249) to modify the rate of change of phase, or slope, applied when the Phase value is changed.

Figure 1-39: Phaser Functions Usage

NOTE

% MODULO_POSITION is in the equation to take into account the modulo (periodicity) of the value.

2.1.13.2 MLPhalnit

2.1.13.3.1 Description

Initializes a phaser Pipe Block. Returns TRUE if the function succeeded.

This function block is automatically called by the Function PipeNetwork(MLPN_CREATE_OBJECTS) if a Phaser Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Phaser Pipe Block is assigned a Name, OUTPUT_PERIOD, PHASE, PHASE_SLOPE_TYPE, and STANDBY_VALUE.

2.1.13.4.2 Arguments

2.1.13.5.3.1 Input

BlockID	Description	ID Name of a Phaser function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ModuloPosition	Description	Rollover Position of the Phaser block
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	360.0
Phase	Description	Amount of Phase adjustment
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	0.0

UseUserSlope	Description	Setting determines if Max Slope or user-defined slope is used
	Data type	BOOL
	Range	0, 1
	Unit	n/a
PhaseSlope	Default	Max Slope
	Description	User-defined slope for making the phase adjustment
	Data type	LREAL
	Range	—
StandbyValue	Unit	User unit/sec
	Default	0.0
	Description	This value is output from the Phaser Block, when the pipe is active, until the "MLPhaWritePhase" (→ p. 248) function is executed.
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	0.0

2.1.13.6.4.2 Output

Default (.Q)	Description	Returns True if the function block is successfully executing
	Data type	BOOL
	Unit	n/a

```
MLPhaInit( PipeNetwork.PhaseAdjust , 720, 30, false, 30 , 10 );
```

2.1.13.10.8.2 Ladder Diagram

2.1.13.11.9.3 Function Block Diagram

2.1.13.12 MLPhaReadActPhase

2.1.13.13.1 Description

Get the actual phase value of a phaser block.

If a "PHASE_SLOPE_USER" (refer to "MLPhaReadSlope" (→ p. 248) and "MLPhaWriteSlope" (→ p. 249)) value is being used, the new phase (refer to "MLPhaWritePhase" (→ p. 248)) isn't set immediately; the phase will be ramped with the slope value from the old phase value to the new phase value. MLPhaReadActPhase returns this ramping value.

"MLPhaReadPhase" (→ p. 247) returns the new value and this also when the phaser is still ramping. If using max slope means no ramping MLPhaReadActPhase and MLPhaReadPhase return always the same value.

2.1.13.14.2 Arguments

2.1.13.15.3.1 Input

2.1.14 Motion Library - PMP

Name	Description	Return type
"MLPmpAbs" (→ p. 251)	Moves to an Absolute Position	BOOL
"MLPmpForcePos" (→ p. 252)	Forces the specified position. Possible only when the block is not moving.	BOOL
"MLPmpInit" (→ p. 253)	Initializes a PMP object (Parabolic Motion Profile generator) with user-defined settings	BOOL
"MLPmpReadAccel" (→ p. 256)	Gets the Acceleration parameter of a PMP block	None
"MLPmpReadFstSpd" (→ p. 257)	Gets the FirstTravelSpeed parameter of a PMP block	None
"MLPmpReadInitPos" (→ p. 258)	Gets the InitialPosition parameter of a PMP block	None
"MLPmpReadJerk" (→ p. 259)	Gets the Jerk parameter of a PMP block	None
"MLPmpReadLstSpd" (→ p. 260)	Gets the LastTravelSpeed parameter of a PMP block	None
"MLPmpRel" (→ p. 261)	Does two subsequent relative moves	BOOL
"MLPmpRun" (→ p. 262)	Jog the generator at the specified speed	BOOL
"MLPmpStatus" (→ p. 263)	Returns the status of the PMP block generator	None
"MLPmpWriteAccel" (→ p. 265)	Sets the acceleration parameter of a PMP block	BOOL
"MLPmpWriteFstSpd" (→ p. 266)	Sets the FirstTravelSpeed parameter of a PMP block	BOOL
"MLPmpWriteJerk" (→ p. 267)	Sets the jerk parameter of a PMP block	BOOL
"MLPmpWriteLstSpd" (→ p. 268)	Sets the LastTravelSpeed parameter of a PMP block	BOOL

2.1.14.1 MLPmpAbs

2.1.14.2.1 Description

Move to an Absolute Position using a parabolic acceleration profile. The FIRST_TRAVEL_SPEED is used as the velocity for the motion. JERK determines the level of parabolic acceleration. Returns TRUE if the function succeeded.

2.1.14.3.2 Arguments

2.1.14.4.3.1 Input

BlockID	Description	ID Name of the PMP function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Position	Description	Absolute Position of motor/load to be at after this FB is complete

Data type	LREAL
Range	—
Unit	User unit
Default	—

2.1.14.5.4.2 Output

Default (.Q)	Description	Returns True if the function block is successfully executing
	Data type	BOOL
	Unit	n/a

2.1.14.11 MLPmpForcePos

2.1.14.12.1 Description

Forces the position of a PMP Block to a specified position. This block can only be executed when motion is not occurring. It can be used to force the PMP starting position to the desired values from which to start motion.

2.1.14.13.2 Arguments

2.1.14.14.3.1 Input

EN	Description	Enables FB to be executed
	Data type	BOOL
	Range	0, 1

	Unit	n/a
	Default	—
Block ID	Description	ID name of the PMP Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Position	Description	Defines the PMP starting position when the motion starts
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.14.15.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

NOTE
 You must use a [pulse contact](#) to start the FB

2.1.14.20.9.3 Function Block Diagram

2.1.14.21 MLPmplnit

2.1.14.22.1 Description

Initializes a Pmp Block for use in a PLC Program. This function block is automatically called by the Function PipeNetwork(MLPN_CREATE_OBJECTS) if a Pmp Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Pmp Pipe Block is assigned a Name, SAMPLING_PERIOD, MODULO_POSITION, FIRST_TRAVEL_SPEED, LAST_TRAVEL_SPEED, ACCELERATION, JERK, and INITIAL Position. Some of these parameters can be changes in an application program using other MLPmp function blocks

A MLPmpRel function block is used to make a bi directional motion. First movement in one direction, then a return motion back to the initial position. A MLPmpAbs function block is use to move one direction to an absolute position.

NOTE

Pmp objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLPmpInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.14.23.2 Arguments

2.1.14.24.3.1 Input

BlockID	Description	ID Name of a PMP function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ModuloPosition	Description	Modulo Position for cyclic motion systems expressed in user logical units (Position Rollover Value)
	Data type	LREAL
	Range	—
	Unit	User unit
Period	Description	Sampling period of the generator expressed according to the update cycle (e.g. 2.0 means the sampling is done once every 2 cycles)
	Data type	LREAL
	Range	—
	Unit	User unit
FirstTravelSpeed	Description	First Travel Speed of the motion
	Data type	LREAL
	Range	—
	Unit	User unit/sec
LastTravelSpeed	Description	Last Travel Speed of the motion
	Data type	LREAL
	Range	—
	Unit	User unit/sec
Acceleration	Description	Acceleration of the Pmp block motion
	Data type	LREAL
	Range	—
	Unit	User unit/sec

	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	1000.0
Jerk	Description	Jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	0
InitialPosition	Description	Initial Position of the Pmp block when the Pipe Network is start up
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	0
Modulo	Description	The available modes are Modulo (True) or No modulo (False)
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

2.1.14.25.4.2 Output

Default (.Q)	Description	Returns True if the function block is successfully executing
	Data type	BOOL
	Unit	n/a

2.1.14.79.9.3 Function Block Diagram

2.1.14.80 MLPmpRel

2.1.14.81.1 Description

This function is used to perform two subsequent relative moves. Using the MLPmpRel function block, the PMP Generator is capable of producing forward-backward motions with a non-stop, jerk-free transition through zero speed (see Figure below). This feature is frequently useful for linear axes which must move back and forward without any pause at one end.

This function can also be used to do a single relative move, ending in zero speed, by setting the **DeltaSecond** argument to zero (0.0). If it is done, for the controlling speed to be the first move, the “Last_Travel_Speed” parameter has to be set equal to or greater than the “First_Travel_Speed” parameter.

In general, the slower of the two “Speeds” is utilized to optimize the S-curve behavior for the move whether it is a 2 or 1 delta move.

If the DeltaSecond argument is non-zero, it must have the opposite sign than the sign of the DeltaFirst argument.

Figure 1-40: PMP Generator Forward & Backward Motion Profile

2.1.14.82.2 Arguments

2.1.14.83.3.1 Input

BlockID	Description	ID Name of the PMP function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
DeltaFirst	Description	Length of first Move
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	Value defined in the setup of a PMP Block within a Pipe Network. It is the “FIRST_TRAVEL_SPEED” field in the parameter tab.
DeltaSecond	Description	Length of second (return) Move
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	Value defined in the setup of a PMP Block within a Pipe Network. It is the “LAST_TRAVEL_SPEED” field in the parameter tab.

2.1.14.84.4.2 Output

Default (.Q)	Description	Returns True if the MLPmIRel successfully completed
	Data type	BOOL
	Unit	n/a

EN	Description	Enables FB to be executed.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
BlockID	Description	ID Name of the PMP function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.14.104.4.2 Output

OK	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

Returns the status of the PMP block generator

Default (.Q)

Description

Value	Description
0	Indicates that the PMP block is idle. No command is currently running in the generator. It can be used to determine that a previous move is complete.
1	Indicates that the PMP block is either accelerating to a position or speed, or is decelerating to a position or speed.
2	Indicates that the PMP block is running at a constant speed.

Set the LastTravelSpeed parameter of a PMP block. Returns TRUE if the function succeeded. Last Travel Speed can also be set when adding a Pmp Block to a Pipe Network and defining the parameters for that block.

2.1.14.141.2 Arguments

2.1.14.142.3.1 Input

BlockID	Description	ID Name of the PMP function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
Last Speed	Description	Last Travel Speed Value
	Data type	LREAL
	Range	> 0
	Unit	User unit/sec
	Default	Value defined in the setup of a PMP Block within a Pipe Network. It is in the "LAST_TRAVEL_SPEED" field in the parameter tab.

2.1.14.143.4.2 Output

Default (.Q)	Description	Returns True if the function block is successfully executing
	Data type	BOOL

Unit n/a

2.1.15 Motion Library - Sampler

Name	Description	Return type
"MLSmpConnect" (→ p. 270)	Connects a sampler block to a pipe network axis or pipe block	BOOL
"MLSmpConECAT" (→ p. 271)	Connects a sampler block to the specified CoE object in a PDO	BOOL
"MLSmpConPLCAxis" (→ p. 274)	Connects a sampler block to a PLCopen axis variable	BOOL
"MLSmpConPNAxis" (→ p. 275)	Connects a sampler block to a Pipe Network axis variable	BOOL
"MLSmplnit" (→ p. 272)	Initializes a sampler object	BOOL

TIP

There is a delay when using an external encoder. The delay is five cycles (2 cycles to read the encoder from the AKD via EtherCAT, 1 cycle for computing, 2 cycles for sending the new position set point to the AKD). This lag error is speed proportional (5 cycles * speed). A Phaser block can be used to compensate for this lag.

2.1.15.1 MLSmpConnect

2.1.15.2.1 Description

Connect a sampler to an axis or pipe block as a value source. Returns TRUE if the function succeeded.

2.1.15.22.10.3 Function Block Diagram

2.1.15.23 MLSmpConnectEx

2.1.15.24.1 Description

Connect a sampler to the specified data source.

NOTE
 This function was deprecated in KAS v2.9. Please use either "MLSmpConECAT" (→ p. 271), "MLSmpConPLCAxis" (→ p. 274), or "MLSmpConPNAxis" (→ p. 275) instead.

2.1.15.25 MLSmpInit

2.1.15.26.1 Description

The purpose of the sampler block is to periodically sample and place into a pipe some output of a source object. The sampled output can typically be the POSITION or SPEED of a source object measured by a resolver, an encoder or some other types of sensor.

The sampler implements the logical connection between an encoder on a physical master axis (the source object) and one or more pipes and performs the function of periodically sampling the source and placing the sampled values into the pipe.

This function block is automatically called by the Function PipeNetwork(MLPN_CREATE_OBJECTS) if a Smp Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Smp Pipe Block is assigned a Name, SAMPLING_PERIOD, MODE, INPUT_VALUE_PERIOD and OUTPUT_VALUE_PERIOD.

2.1.15.27.2.1 Related Function Blocks

"MLSmpConnect" (→ p. 270), "MLSmpConECAT" (→ p. 271), "MLSmpConPLCAxis" (→ p. 274), "MLSmpConPNAxis" (→ p. 275)

2.1.15.28.3 Arguments

2.1.15.29.4.1 Input

BlockID	Description	ID Name of the SMP function block in the Pipe Network
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
SamplingPeriod	Description	period that the device is sampled
	Data type	LREAL
	Range	0.25 to ?
	Unit	millisecond
	Default	1.0
Mode	Description	Sampled output can be either position or velocity
	Data type	DINT
	Range	[1 , 2] Position or Speed
	Unit	n/a
	Default	position
InputModuloPosition	Description	Period of the input signal. This should be set equal to 2^{32} (4294967296).
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	360.0
OutputModuloPosition	Description	Period of the output signal
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	360.0

2.1.15.30.5.2 Output

Default (.Q)	Description	Smp Block successfully initiated
	Data type	BOOL
	Unit	n/a

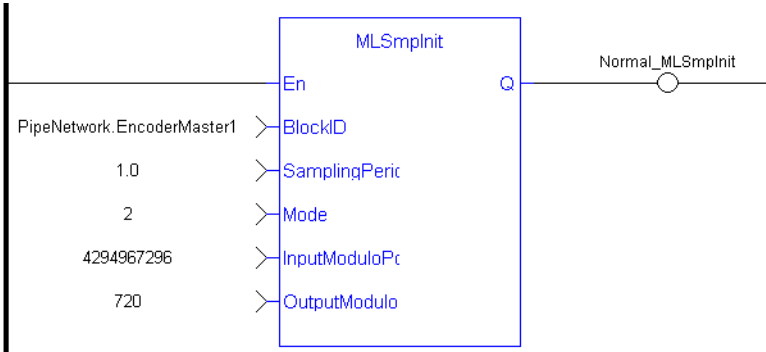

2.1.15.31.6 Example

2.1.15.32.7.1 Structured Text

```

2.1.16 Motion Library - Synchronizer

TIP

- For a Synchronizer example, see "Usage example of Synchronizer Functions" (→ p. 285)

Name	Description	Return type
MLSyncInit	Initializes a synchronizer Pipe Block	BOOL
MLSyncReadDeltaS	Gets the output phasing value of a synchronizer block	None
MLSyncStart	Starts a synchronization of a synchronizer Pipe Block	BOOL
MLSyncStop	De-synchronizes a synchronizer Pipe Block	BOOL
MLSyncWriteDeltaS	Sets the output phasing value of a synchronizer block	BOOL

2.1.16.1 MLSyncInit

2.1.16.2.1 Description

Initializes a synchronizer Pipe Block. Returns TRUE if the function succeeded.

This FB is automatically created in the compiled code of a Pipe Network.

This function block is part of the MLPN_CREATE_OBJECT to initialize the Pipe Network. It is called at the beginning of an application program with the function call:

```
PipeNetwork (MLPN_CREATE_OBJECTS) ;
```

2.1.16.3.2 Arguments

2.1.16.4.3.1 Input

BlockID	Description	Name of the Pipe Network Block
	Data type	DINT

	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
ModuloPosition	Description	The modulo distance
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—
CurveType	Description	The curve type to the motion when starting and stopping synchronization. Option are Parabolic or Polynomial
	Data type	DINT
	Range	[1 , 2] (1 = Parabolic, 2 = Polynomial)
	Unit	n/a
	Default	—
DeltaS	Description	The Distance to get in or out of synchronization. This parameter is used in the MLSyncStart and MLSyncStop FunctionBlocks
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.1.16.5.4.2 Output

Default (.Q)	Description	Function Block Execute Successfully
	Data type	BOOL

2.1.16.48 Usage example of Synchronizer Functions

When you call the **MLSyncStop** function, the output value is adapted according to the specified Stop-Position (point B).

The **OUTPUT_PHASING** parameter is used to define point A, where the flow follows a curve in order to smooth the output value.

When you call the **MLSyncStart** function, the output value is adapted to catch up with the input value.

The **OUTPUT_PHASING** parameter is also used to define a curve in order to smooth the output value.

Figure 1-50: Synchronizer Functions Usage

2.1.17 Motion Library - Trigger

TIP

- For an example of Trigger functions, see "Usage example of Trigger Functions" (→ p. 297)

Name	Description	Return type
MLTrigClearFlag	Clears the flag of an initiated Trigger block	BOOL
MLTrigInit	Initializes a Trigger object	BOOL
MLTrigsTriggered	Checks if the selected block has been triggered	BOOL
MLTrigReadDelay	Returns the time that the trigger block uses to compensate the delay of the sensor that captures the triggering signal	None
MLTrigReadPos	Returns the position of the block at the moment when it was triggered	None
MLTrigReadTime	Returns the time of the moment where the block was triggered in milliseconds	None
"MLTrigSetEdge" (→ p. 295)	Sets the edge configuration for a Trigger object	BOOL
MLTrigWriteDelay	Sets the time that the trigger block uses to compensate for the delay introduced by the sensor that captures the triggering signal	BOOL

2.1.17.1 MLTrigClearFlag

2.1.17.2.1 Description

Clears the flag of an initiated Trigger block so the block can capture the position and time of the next event. Once triggered, a block has to be reset with this command before it can be triggered again. All events that are sent to a block while in a triggered state are ignored and the position and time information is lost.

IMPORTANT

The Fast Input assigned to a Trigger block has to be reset as well before information on a new event can be captured. MLAxisRstFastIn is generally used at the same time as MLTrigClearFlag

2.1.17.3.2 Arguments

2.1.17.4.3.1 Input

BlockID	Description	ID number of an initiated Trigger object
	Data type	DINT

2.1.17.10.9.2 Ladder Diagram**2.1.17.11.10.3 Function Block Diagram****2.1.17.12 MLTrigInit****2.1.17.13.1 Description**

Initializes a Trigger object for use in a PLC Program. Function block is automatically called if a Trigger Block is added to the Pipe Network, with user-defined settings entered in the Pipe Blocks Properties screen.

The Trigger object monitors a selected Fast Input and captures the time of a rising or falling edge event. With the time and pipe position information the Trigger object extrapolates the axis position when the Fast Input event occurred.

Parameters to enter include the name of the Pipe Block, the Axis where the Fast Input is located, the number of the desired Fast Input, and whether to trigger on the rising or falling edge of the input.

NOTE

Trigger objects are normally created in the Pipe Network using the graphical engine. Then you do not have to add MLTrigInit function blocks to their programs. Parameters are entered directly in pop-up windows, and the code is then automatically added to the current project.

2.1.17.14.2 Arguments

2.1.17.15.3.1 Input

BlockID	Description	ID number of a created Pipe Block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Input_Axis	Description	Name of the axis where the Fast Input is located
	Data type	STRING
	Range	—
	Unit	n/a
	Default	—
InputID	Description	ID number of the Fast Input 0 = Capture Engine 0 1 = Capture Engine 1 Range is [0, 1] For information on configuring the capture engines, refer to AKD Capture Engine Configuration.
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
EdgeID	Description	Trigger at rising or falling edge of Fast Input. Enter 1 for rising edge, 2 for falling edge, and 0 disables the Fast Input
	Data type	DINT
	Range	[0 , 2]
	Unit	n/a
	Default	1 (Rising edge)

2.1.17.16.4.2 Output

2.1.17.32.9.2 Function Block Diagram

2.1.17.33 MLTrigReadDelay

2.1.17.34.1 Description

Electronic sensors are not able to respond immediately to a signal. Sensors usually require a certain amount of time to process a change of state in their input signal. This function returns the delay that has been programmed in a trigger block by the [MLTrigWriteDelay](#) function to compensate for this reaction time required by the sensor.

2.1.17.35.2.1 Input

BlockID	Description	Identifier of the trigger block whose delay is requested
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
En	Description	Enables execution
	Data type	BOOL
	Unit	n/a
	Default	-

2.1.17.36.3.2 Output

Delay	Description	Value of the delay compensation currently applied by the trigger block
	Data type	LREAL
	Unit	microseconds
OK	Description	Returns true when the function successfully executes
	Data type	BOOL
	Unit	n/a

2.1.17.37.4 Related Functions

[MLTrigWriteDelay](#)

2.1.17.38 MLTrigReadPos

2.1.17.39.1 Description

Returns the position of the block at the moment when it was triggered by the Trigger Block's selected Fast Input. This value is only valid when TrigsTriggered() returns TRUE. The Trigger block extrapolates the output value based on the timestamp of the Fast Input event to provide an accurate position even if the event occurs in the middle of a program cycle.

Once triggered, a block has to be reset before it can be triggered again. All events that are sent to a block while in a triggered state are ignored and the position and time information is lost.

Figure 1-52: MLTrigReadPos

2.1.17.40.2 Arguments

2.1.17.41.3.1 Input

BlockID	Description	ID number of an initiated Trigger object
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

2.1.17.42.4.2 Output

Position	Description	Returns the position of the selected block's Axis at the moment when it was triggered
	Data type	LREAL
	Unit	User unit

2.1.17.69 MLTrigWriteDelay

2.1.17.70.1 Description

Electronic sensors are not able to respond immediately to a signal. Sensors usually require a certain amount of time to process a change of state in their input signal. This function allows the trigger block to calculate the exact moment at which a signal was triggered by letting you specify the delay introduced by the sensor.

2.1.17.71.2.1 Input

BlockID	Description	Identifier of the trigger block
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
Delay	Description	Reaction time of the sensor that the trigger block has to compensate
	Data type	LREAL
	Range	—
	Unit	microseconds
	Default	—

2.1.17.72.3.2 Output

Default (.Q)	Description	Returns TRUE if the delay is successfully set
	Data type	BOOL
	Unit	n/a

2.1.17.73.4.3 Return Type

BOOL

2.1.17.74.5 Related Functions

[MLTrigReadDelay](#)

2.1.17.75 Usage example of Trigger Functions

When you call the **MLTrigClearFlag** function, the flag for trigger is reset to False.

When a Fast Input is set, the **MLTrigsTriggered** function returns True.

Then you can call the **MLTrigReadPos** and **MLTrigReadTime** functions to get more details.

Figure 1-54: Trigger Functions Usage

! IMPORTANT

The trigger delay has to be calculated by **you** and set with the [MLTrigWriteDelay](#) function block. This delay belongs to the sensor and it is additional to the [MLTrigReadTime](#) / [MLTrigReadPos](#).

2.2 Motion Library / PLCopen

Functions sorted in alphabetical order:

Name	Description
MC_AbortTrigger	Abort MC_TouchProbe
"MC_AddSuperAxis" (→ p. 403)	Add an axis to the axis's list of assigned, superimposed axes.
MC_CamIn	Performs a slave axis move based on the Cam Table
MC_CamOut	Disengages the slave axis from a MC_CamIn move
"MC_CamResumePos" (→ p. 361)	Returns the slave axis position for resuming an MC_CamIn move
"MC_CamStartPos" (→ p. 363)	Returns the slave axis position for starting an MC_CamIn move
MC_CamTblSelect	Defined to read and initialize the specified profile
MC_ClearFaults	Clear Drive Faults
MC_CreateAxis	Creates a PLCopen Axis
MC_EStop	Performs a Emergency stop
"MC_ErrorDescription" (→ p. 407)	Converts the PLCopen error IDs into message strings.
MC_GearIn	Performs a slave axis move based on the ratio
MC_GearInPos	Performs a slave axis move based on the ratio
MC_GearOut	Disengages the slave axis from a MC_GearIn or MC_GearInPos move
MC_Halt	Decelerates an axis to zero velocity

Name	Description
MC_InitAxis	Initializes a PLCopen Servo Axis' data
MC_MachRegist	Runs Mark-to-Machine registration
MC_MarkRegist	Runs Mark-to-Mark registration
MC_MoveAbsolute	Performs a single-axis move to a specified endpoint position
MC_MoveAdditive	Performs a single-axis move for a specified distance from the endpoint of the previous move
"MC_MoveRelative" (→ p. 341)	Performs a single-axis move for a specified distance
MC_MoveSuperimp	Performs a single-axis move which is superimposed upon the active move
MC_MoveVelocity	Performs a single-axis non-ending move at a specified velocity
MC_Phasing	Performs a master position phase shift for the slave axis
MC_Power	Requests to enable the drive and close the loop, or disable the drive and open the loop
MC_ReadActPos	Reads the actual position of the axis
MC_ReadActVel	Reads the actual velocity of the axis
MC_ReadAxisErr	Returns the error status of the specified axis
MC_ReadBoolPar	Returns the value of the specified Boolean axis parameter
MC_ReadParam	Returns the value of the specified axis parameter
MC_ReadStatus	Returns the state of the specified axis
MC_Reference	Defines the position at the reference location for PLCopen Axis
"MC_RemSuperAxis" (→ p. 405)	Remove an axis from the axis's list of assigned, superimposed axes.
MC_ResetError	Resets the errors of the specified axis
MC_SetOverride	Writes velocity and acceleration override factors
MC_SetPosition	Deprecated by "MC_SetPos" (→ p. 389)
"MC_SetPos" (→ p. 389)	Sets a new axis position
MC_Stop	Aborts the active move, removes the next move from the queue, performs a controlled stop, and switches the axis to Stopping state
MC_StopRegist	Turns off registration for the specified axis
MC_SyncSlaves	Specifies synchronized slaves
MC_TouchProbe	Arm a Fast Input and capture an axis position
MC_WriteBoolPar	Writes the specified axis Boolean parameter
MC_WriteParam	Writes the specified axis parameter

2.2.1 Control Functions

This set of functions provide general controls to drives and axes.

2.2.1.1 MC_ClearFaults

2.2.1.2.1 Description

The MC_ClearFaults function sends a request to the drive to clear any drive faults that exists.

NOTE

The condition causing the drive fault has to be corrected before calling this function. If the fault condition still exists when this function is called, this function sends a request to the drive but the drive faults remain.

This function does **not** reset axis errors. [MC_ResetError](#) is required to reset axis errors.

Figure 1-55: MC_ClearFaults

2.2.1.3.2 Arguments

2.2.1.4.3.1 Input

En	Description	Function enable – execute function. This Input must be on shot.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	AXIS_REF.AXIS_NUM is the master axis number
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

2.2.1.5.4.2 Output

OK	Description	Boolean output to indicate successful request. This output does not indicate that the fault are cleared, but simply indicates the request was made.
	Data type	BOOL

2.2.1.6.5 Usage

Upon the positive transition of the EN input, this function requests a Fault Reset of the Drive for the Axis defined in the axis input of this function.

2.2.1.7.6 Related Functions

[MC_ResetError](#)

2.2.1.10.9.2 Ladder Diagram

2.2.1.11 MC_CreateAxis

2.2.1.12.1 Description

This function creates a PLCOpen Axis. A call to this function is automatically generated when the application is compiled, based on the data entered in the PLCOpen Axis Data dialog.

! IMPORTANT

MC_CreateAxis must be called between "MLMotionInit" (→ p. 420) and "MLMotionStart" (→ p. 421).

Figure 1-56: MC_CreateAxis

2.2.1.13.2 Arguments

2.2.1.14.3.1 Input

En	Description	Requests to create a PLCopen axis
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxisName	Description	Axis name
	Data type	STRING
	Range	—
	Unit	n/a
BusInterface	Description	Bus interface identifier: "EtherCATDriver" = EtherCAT interface "MSBusDriver" = KAS Simulator interface
	Data type	STRING
	Range	—
	Unit	n/a
BusAddress	Description	Address of the drive on the bus
	Data type	DINT
	Range	—
	Unit	n/a

	Range	bus dependent
	Unit	n/a
	Default	—
AxisNumber	Description	Axis number
	Data type	UINT
	Range	[1,256]
	Unit	n/a
	Default	—
AxisType	Description	Axis type: 0 (MC_AXIS_TYPE_SERVO) denotes servo 1 (MC_AXIS_TYPE_DIGITIZING) denotes digitizing 2 (MC_AXIS_TYPE_VIRTUAL_SERVO) denotes virtual servo
	Data type	USINT
	Range	[0,1]
	Unit	n/a
	Default	—
UserUnits	Description	User unit portion of the user unit/feedback unit ratio
	Data type	UDINT
	Range	[1,4294967296]
	Unit	User unit
	Default	—
FeedbackUnits	Description	Feedback unit portion of the user unit/feedback unit ratio
	Data type	UDINT
	Range	[1,4294967296]
	Unit	feedback units. Note: <i>The FeedbackUnits input must be a power of 2.</i> If input FeedbackUnits is not a power of two, the axis will not be created, and the OK output will be FALSE.
	Default	—
Rollover	Description	Rollover position (0 = no rollover)
	Data type	UDINT
	Range	[0, 4294967296]
	Unit	User unit
	Default	—
UpdateRate	Description	Servo update rate (0, 1, and 2 are reserved for future enhancements) 3 = 125 µsec 4 = 250 µsec 5 = 500 µsec 6 = 1 msec 7 = 2 msec 8 = 4 msec 9 = 8 msec
	Data type	UINT
	Range	[3,9]
	Unit	n/a
	Default	—

2.2.1.15.4.2 Output

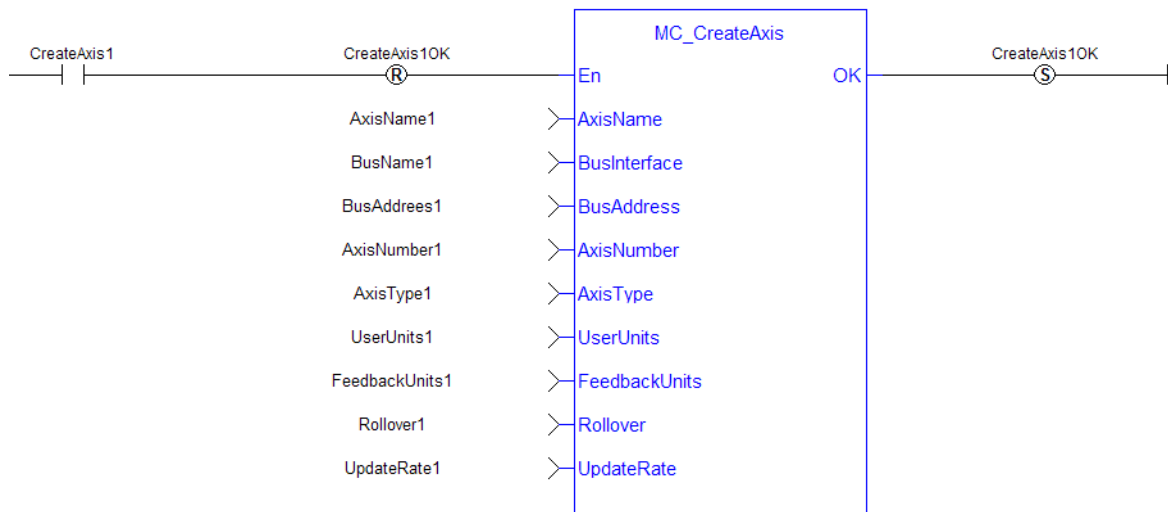

OK	Description	Indicates the axis has been created
	Data type	BOOL

2.2.1.16.5 Example

2.2.1.17.6.1 Structured Text

```
(* MC_CreateAxis ST example *)
MC_CreateAxis( 'PLCopenAxis1', 'EtherCATDriver', 1001, 1, MC_AXIS_TYPE_
SERVO, 360, 1048576, 0, 3 );
```

2.2.1.18.7.2 Ladder Diagram

2.2.1.19 MC_EStop

2.2.1.20.1 Description

This function causes an emergency stop (E-stop). An E-stop stops motion interpolation, clear all moves from the queue (active and next), change the axis state to [ErrorStop](#), and request the drive to open the position loop and disable the drive. The E-stop remains in effect until the application calls [MC_ResetError](#) to reset the E-stop.

Figure 1-57: MC_EStop

2.2.1.21.2 Arguments

2.2.1.22.3.1 Input

En	Description	A positive transition of this input causes an E-stop on the specified axis
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Axis identifier

Data type	AXIS_REF 1-256
Range	The AXIS_NUM element of the AXIS_REF structure must be in the range [1-256]
Unit	n/a
Default	—

2.2.1.23.4.2 Output

OK	Description	Indicates the E-stop was executed. If an invalid Axis input was specified, this output is not energized and no E-stop is performed.
	Data type	BOOL

2.2.1.24.5 Usage

Call MC_EStop to generate an emergency stop for an axis.

Call MC_ResetError to reset the emergency stop.

2.2.1.29 MC_InitAxis

2.2.1.30.1 Description

MC_InitAxis initializes a PLCopen Servo Axis' data. A call to this function is automatically generated when the application is compiled, based on the data entered in the PLCopen Axis Data dialog.

Figure 1-58: MC_InitAxis

2.2.1.31.2 Arguments

2.2.1.32.3.1 Input

En	Description	Request to initialize a PLCopen servo axis
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxisNumber	Description	Servo axis number
	Data type	UINT
	Range	[1,256]
	Unit	none
VelocityLimit	Description	Velocity limit
	Data type	LREAL
	Range	—
	Unit	User unit/sec
LowerLimit	Description	Lower position limit
	Data type	LREAL
	Range	—
	Unit	User unit
UpperLimit	Description	Upper position limit
	Data type	LREAL
	Range	—
	Unit	User unit
LimitControl	Description	Establishes how position limits are applied 0 = apply position limits 1 = ignore position limits 2 = ignore limits until referenced
	Data type	UINT
	Range	[0,2]
	Unit	n/a
	Default	—

PosErrorLimit	Description	Position error limit – when the Position Error (command position – actual position) exceeds this value, an E-stop is generated
	Data type	LREAL
	Range	—
	Unit	User unit
InPositionBand	Description	In-position bandwidth – when the axis actual position is within this distance from its programmed endpoint, the axis is considered “in position”
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.2.1.33.4.2 Output

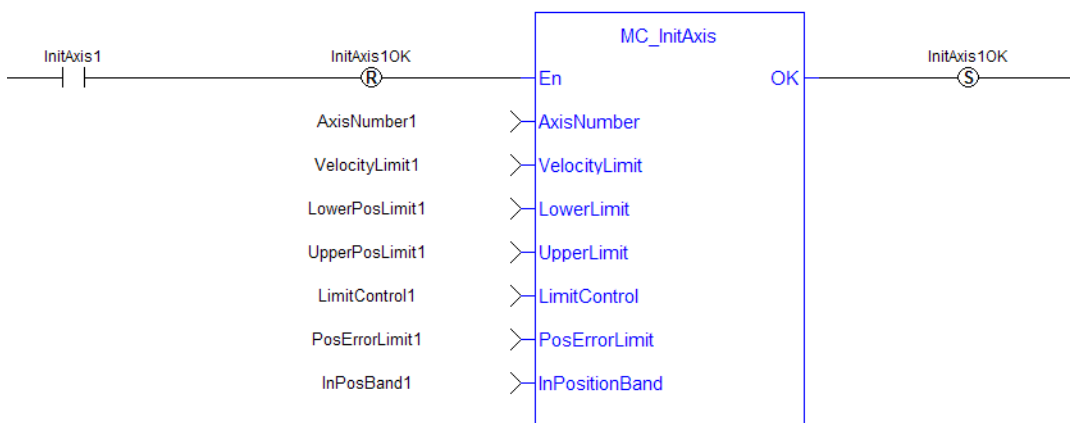

OK	Description	Indicates the initialization is complete
	Data type	BOOL

2.2.1.34.5 Example

```
(* MC_InitAxis ST example *)
MC_InitAxis( 1, 0, 0, 0, 2, 0, 0 );
```

2.2.1.36.7.2 Ladder Diagram

2.2.1.37 MC_Power

2.2.1.38.1 Description

This function block requests to enable the drive and close the position loop, or disable the drive and open the position loop. The Status output indicates the state of the position loop. If the position loop is open, the axis command position is set to the actual position of the axis and tracks the actual position.

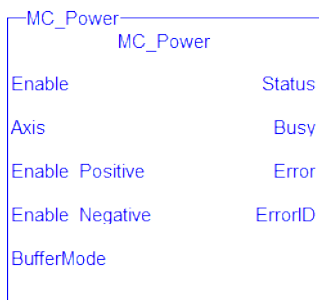

Figure 1-59: MC_Power

NOTE
 You must be careful if you have more than one instance of MC_Power FB for the same drive, scanned in the same cycle. The problem arises when one instance requests the drive to enable and the other requests the same drive to disable.
 To avoid this trap, it is recommended to have only one instance of MC_Power for all of your active programs.

2.2.1.39.2 Arguments

2.2.1.40.3.1 Input

Enable	Description	When this transitions go to high, the control closes the servo loop and sends a command to the drive to enable. When this transitions go to low, the control opens the servo loop and sends a command to the drive to disable.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
Enable Positive	Description	<i>for future enhancement</i>
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Enable Negative	Description	<i>for future enhancement</i>
	Data type	BOOL
	Range	0, 1
	Unit	n/a
BufferMode	Description	Unused
	Data type	SINT
	Range	[0]

Unit n/a
Default —

2.2.1.41.4.2 Output

Status	Description	Indicates the enabled/disabled state of the drive
	Data type	BOOL
Busy	Description	for future enhancement – always false
	Data type	BOOL
Error	Description	Indicates an invalid input was specified
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

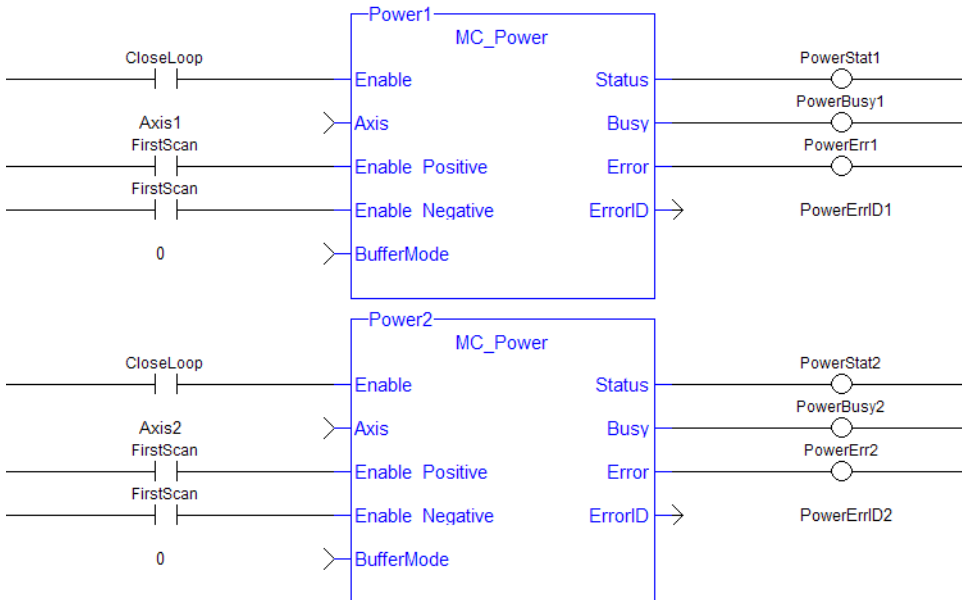

2.2.1.42.5 Example

2.2.1.53.8.4 Ladder Diagram

2.2.1.54 MC_ResetError

2.2.1.55.1 Description

The function MC_ResetError resets the errors of a specified axis.

This function performs in sequence the following tasks:

- It sends a request to the drive to clear any drive faults that exists
- Then it resets the axis errors

NOTE

The condition causing the axis error has to be corrected before calling this function. The axis error still remains until the error condition exists when this function is called.

See also transition 15 in the status machine of the CANopen protocol.

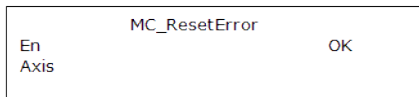

Figure 1-61: MC_ResetError

2.2.1.56.2 Arguments

2.2.1.57.3.1 Input

En	Description	Requests to reset the axis errors
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function)
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

```
//reset the axis and drive errors for Axis 1
MC_ResetError( Axis1 );
```

2.2.1.61.7.2 Ladder Diagram

2.2.1.62 MC_Stop

2.2.1.63.1 Description

This function block aborts the active move, removes the next move from the queue, performs a controlled stop at the specified deceleration rate, and switches the axis to Stopping state.

MC_Stop cannot be aborted. This means that, while in Stopping state, no function block can command any motion on the axis. The axis remains in Stopping state until it reaches zero velocity and the Execute input is low. The application program can hold the axis in Stopping state even after it reaches zero velocity by leaving the Execute input high.

Figure 1-62: MC_Stop

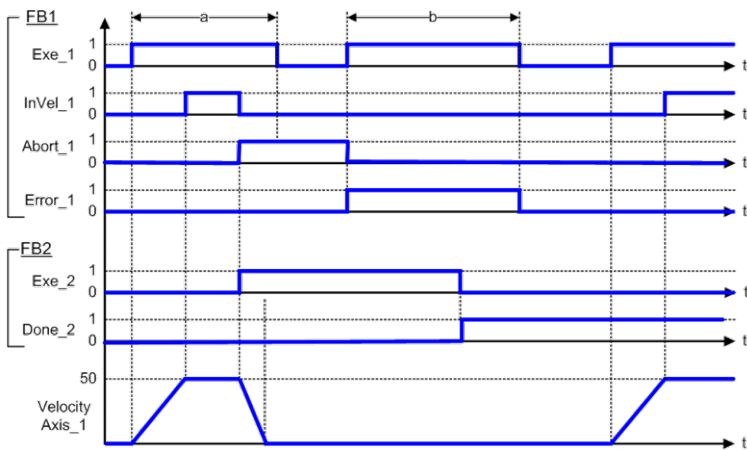

2.2.1.64.2 Time Diagram

The example below shows the behavior of the combination of a MC_Stop FB with a [MC_MoveVelocity](#) FB.

- A rotating axis is ramped down with FB2 MC_Stop
- The axis rejects motion commands as long as MC_Stop parameter “Execute” = TRUE

FB1 MC_MoveVelocity reports an error indicating the busy MC_Stop command.

2.2.1.65.3 Arguments

2.2.1.66.4.1 Input

Execute	Description	Requests to stop the axis. It can be held high to prevent any other moves from being queued
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Maximum deceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—

2.2.1.67.5.2 Output

Done	Description	Indicates the axis has reached zero velocity AND the Execute input is low
	Data type	BOOL
Busy	Description	High from the time the Execute input goes high until the axis reaches zero velocity AND the Execute input is low

Active	Data type	BOOL
	Description	High from the time the MC_Stop move becomes the active move, until the axis reaches zero velocity AND the Execute input is low
Error	Data type	BOOL
	Description	Indicates an invalid input was specified
ErrorID	Data type	BOOL
	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.1.68.6 Example

2.2.1.69.7.1 Structured Text

```
(* MC_Stop ST example *)

Inst_MC_Stop( StopRequest , Axis1, 100.0, 100.0 ); //Inst_MC_Stop is an

Put Axis 1 into Stopping Mode

2.2.2 I/O Functions

This set of functions provides I/O control over TouchProbe functions.

2.2.2.1 MC_AbortTrigger

2.2.2.1.1 Description

When the Execute input transitions from low to high, this function block aborts an MC_TouchProbe function block.

2.2.2.3.2 Arguments

2.2.2.4.3.1 Input

Execute	Description	Enables execution
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Specifies the axis that was specified in the MC_TouchProbe function block which is to be aborted
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
TriggerInput	Description	Specifies the Fast Input that was specified in the MC_TouchProbe function block which is to be aborted. The elements of TriggerInput are as follows: InputID INT; 0 = Capture Engine 0 1 = Capture Engine 1 Range is [0,1] For information on configuring the capture engines, refer to AKD Capture Engine Configuration. Direction INT; 1 = rising edge, 2 = falling edge Range is [1,2] TrigID INT; is the axis number of the input. 0 indicates that the trigger axis is to be the same as Axis.AXIS_NUM. Range is [0,256]
	NOTE	TrigMode INT (TriggerInput.TrigMode) is not presently supported by this function. The TriggerInput.Mode may be supported in a future software version.
	Data type	TRIGGER_REF
	Range	See Description above
	Unit	n/a
	Default	—

2.2.2.5.4.2 Output

Done	Description	Function block has completed
	Data type	BOOL
Busy	Description	Indicates the function block is currently executing
	Data type	BOOL
Error	Description	Indicates the function block did not complete due to an error. The ErrorID output indicates the type of error when this output is high
	Data type	BOOL
ErrorID	Description	When the Error output is high, this output indicates the type of error. When the Error output is low, this output is undefined
	Data type	INT

2.2.2.6.5 Usage

This function block is used to abort an MC_TouchProbe function block.

2.2.2.7.6 Related Functions

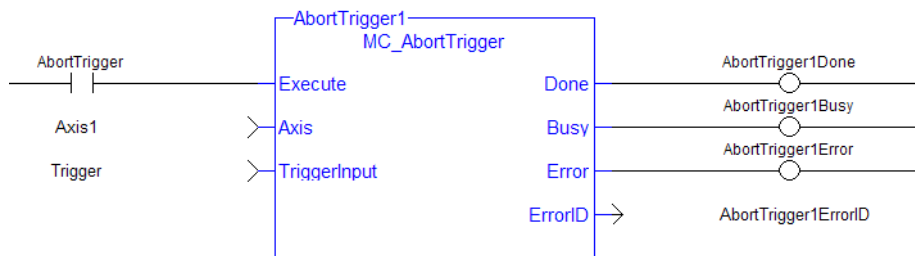

[MC_TouchProbe](#)

2.2.2.8.7 Example

2.2.2.9.8.1 Structured Text

```
(* MC_AbortTrigger ST example *)
Inst_MC_AbortTrigger( AbortReq, Axis1, TriggerInputRef );
//Inst_MC_AbortTrigger is an instance of MC_AbortTrigger
```

2.2.2.10.9.2 Ladder Diagram

2.2.2.11 MC_TouchProbe

2.2.2.12.1 Description

This function block arms a Fast Input and returns the latched position when the Fast Input event occurs. This function block causes no motion.

When the Execute input transitions from low to high, the control requests the drive to arm its Fast Input to latch the axis position when a Fast Input occurs. The Axis input specifies which axis's position to latch and the TriggerInput input specifies which Fast Input to use and whether to trigger on the rising or falling edge of the Fast Input. When the Fast Input event occurs, the drive latches the axis's position. This function block then returns the latched position at the RecordedPosition output and set the Done output high. This process can be canceled with the AbortTrigger function block.

If the WindowOnly input is high, the FirstPosition input and the LastPosition input define a window in which a Fast Input is accepted. Any Fast Input events that occur outside the window is ignored.

If First Position \leq LastPosition, the window in which a Fast Input is accepted is:

FastInputPosition \geq FirstPosition AND FastInputPosition \leq LastPosition.

If First Position $>$ LastPosition, the window in which a Fast Input is accepted is:

FastInputPosition \geq FirstPosition OR FastInputPosition \leq LastPosition.

The following figure shows the ladder diagram view of the MC_TouchProbe function block:

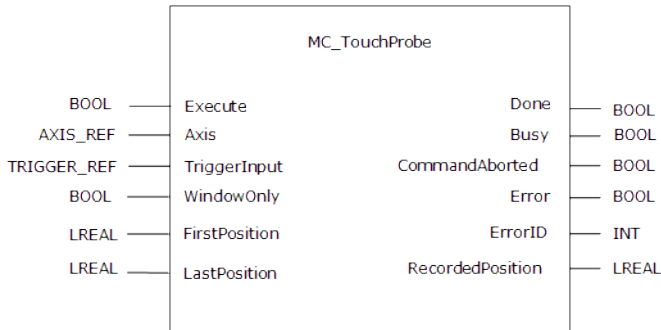

Figure 1-63: MC_TouchProbe

TIP

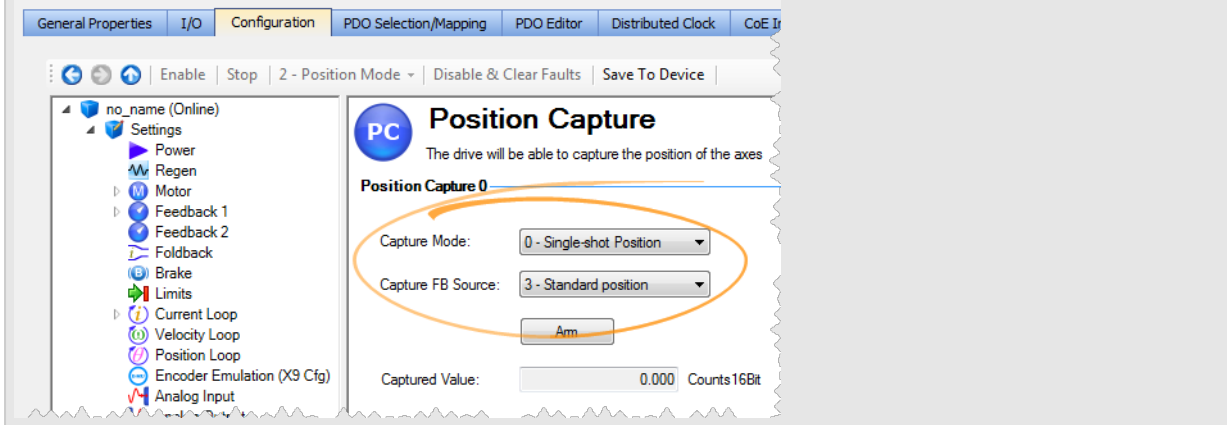

The accuracy of captured position data depends on the travel velocity. Please see the article [MC_TouchProbe and Time-Based Capture](#) on [KDN](#) for more information and how to correct for timing.

TIP

To use Capture Engine 1 modify the input PDOs that are used and add the Latch Position 1 parameter.

TIP

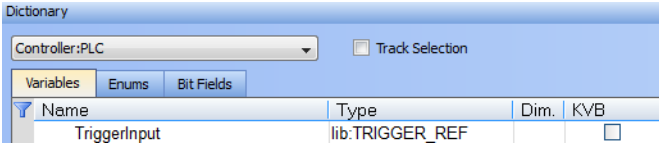

When using position-based capture, the proper Capture Mode and FB Source may need to be set up in the drive.

2.2.2.13.2 Arguments

2.2.2.14.3.1 Input

Execute	Description	Enables execution
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Selects the axis for which the position is latched
	Data type	AXIS_REF

	Range	[1,256]
	Unit	n/a
	Default	—
TriggerInput	Description	Sets up the mechanism for the capture input signal.
	Data type	TRIGGER_REF - an instance of the TRIGGER_REF reference function must first be setup in the Project Dictionary, as seen here.
		 <p>The screenshot shows a 'Dictionary' window with a dropdown menu set to 'Controller:PLC'. Below the menu are tabs for 'Variables', 'Enums', and 'Bit Fields'. A table lists 'TriggerInput' with type 'lib:TRIGGER_REF', dimension 'Dim.', and 'KVB'.</p>
Elements		<u>Capture Engine (drive capture engine to be used)</u> INT TriggerInput.InputID 0 = Capture Engine 0 1 = Capture Engine 1 Range is [0,1] For information on configuring the capture engines, refer to AKD Capture Engine Configuration.
		<u>Trigger Direction (input signal's edge to capture)</u> INT TriggerInput.Direction 1 = rising edge 2 = falling edge Range is [1,2]
		<u>Axis Number (where input comes from)</u> INT TriggerInput.TrigID 0 = trigger axis is to be the same as Axis.AXIS_NUM. Range is [0,256]
		<u>Trigger Mode (capture method)</u> INT TriggerInput.TrigMode 0 = time based capture 1 = position based capture. For position based capture the TrigID must be the same as the Axis_Ref. Range is [0,1]
	Unit	n/a
	Default	—
WindowOnly	Description	Enables a position latching window. When this input is set, a window is defined by the FirstPosition and LastPosition inputs. Any Fast Input event that occurs outside the window is ignored. The first Fast Input event that occurs within the window latches the axis position
	Data type	BOOL
	Range	—
	Unit	n/a
	Default	—
FirstPosition	Description	See the function block Description above for an explanation of how this input and the LastPosition input define the window. This input is only applicable when the WindowOnly input is high. If the WindowOnly input is low, this input is ignored
	Data type	LREAL
	Range	—
	Unit	User unit

	Default	—
LastPosition	Description	See the function block Description above for an explanation of how this input and the FirstPosition input define the window. This input is only applicable when the WindowOnly input is high. If the WindowOnly input is low, this input is ignored
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—

2.2.2.15.4.2 Output

Done	Description	Function block has completed and the RecordedPosition output is valid
	Data type	BOOL
Busy	Description	Indicates that the specified input is arming or is armed, and waiting for the trigger and recording of the position to occur
	Data type	BOOL
CommandAborted	Description	A TriggerAbort function block has executed and canceled this function
	Data type	BOOL
Error	Description	The function block has not completed successfully due to an error. The ErrorID output indicates the type of error
	Data type	BOOL
ErrorID	Description	When the Error output is high, this output indicates the type of error. When the Error output is low, this output is undefined
	Data type	INT
RecordedPosition	Description	When the Done output goes high, this output returns the latched position. When the Done output is low, this output is undefined
	Data type	LREAL
	Unit	User unit

2.2.2.16.5 Usage

This function block can be used to:

- Perform registration
- Determine the position of a product
- Measure product length

2.2.2.17.6 Limitations

- Both high speed inputs cannot be used at the same time.
- TheTrigMode option is only used by MC_TouchProbe.

2.2.3 Information Functions

This set of functions provides feedback and allows you to writer parameters.

2.2.3.1 MC_ReadActPos

2.2.3.2.1 Description

The MC_ReadActPos function block reads the actual position of the axis.

Figure 1-64: MC_ReadActPos

2.2.3.3.2 Arguments

2.2.3.4.3.1 Input

Enable	Description	Request to read the axis's actual position Keeps continuously to read the actual position every PLC cycle, as long as the Enable remains high
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.)
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

2.2.3.5.4.2 Output

Valid	Description	Indicates the value at the Position output is available
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE.
	Data type	INT
Position	Description	Actual position of the axis.
	Unit	User unit
	Data type	LREAL

2.2.3.6.5 Example

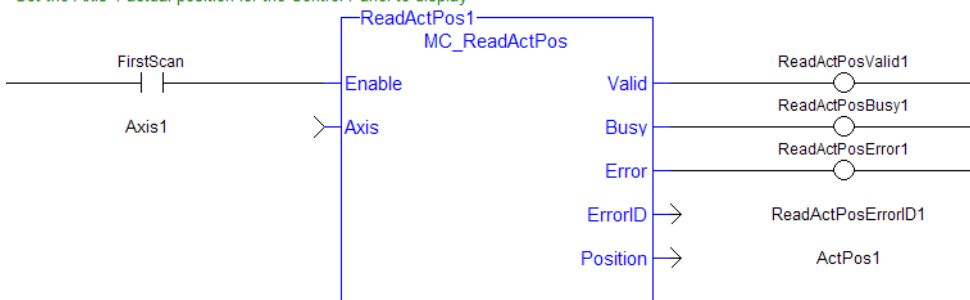

2.2.3.7.6.1 Structured Text

```
(* MC_ReadActPos ST example *)
Inst_MC_ReadActPos( TRUE, Axis1 );
//Inst_MC_ReadActPos is an instance of MC_ReadActPos function block

Get the Axis 1 actual position for the Control Panel to display

2.2.3.9 MC_ReadActVel

2.2.3.10.1 Description

The MC_ReadActVel function block reads the actual velocity of the axis.

Figure 1-65: MC_ReadActVel

2.2.3.11.2 Arguments

2.2.3.12.3.1 Input

Enable	Description	Requests to read the axis's actual velocity
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

2.2.3.13.4.2 Output

Valid	Description	Indicates the value at the ActualVelocity output is available
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE.
	Data type	INT
ActualVelocity	Description	Actual velocity of the axis. Please note that oscillations may be seen due to this being an instant velocity, not an average velocity.
	Unit	User unit/sec
	Data type	LREAL

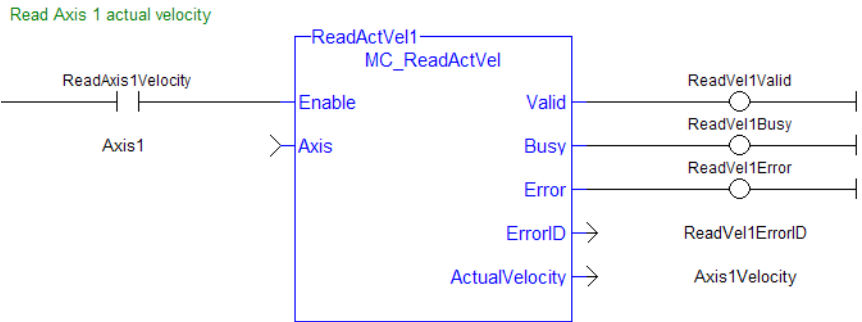

2.2.3.14.5 Example

2.2.3.15.6.1 Structured Text

```
* MC_ReadActVel ST example *);
Inst_MC_ReadActVel( TRUE, Axis1 ); //Inst_MC_ReadActVel is an instance of

output into a user defined variable
```

2.2.3.16.7.2 Ladder Diagram

2.2.3.17 MC_ReadAxisErr

2.2.3.18.1 Description

The Function Block MC_ReadAxisErr returns the error status of the specified axis.

Figure 1-66: MC_ReadAxisErr

2.2.3.19.2 Arguments

2.2.3.20.3.1 Input

Enable	Description	requests to read the error status of the axis
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

2.2.3.21.4.2 Output

Valid	Description	Indicates the AxisErrorID output is valid
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE

AxisErrorID	Data type	INT
	Description	Indicates the error status of the axis. Each bit indicates a specific error. Both emergency-stop (E-stop) and controlled-stop (C-stop) errors are indicated. The table below defines the bits of this output.
	Data type	INT

Hexadecimal	Decimal	Description
0000H	0	No Error
0001H	1	User-set E-stop via MC_EStop, E-stop
0002H	2	Loss of Feedback, E-stop
0004H	4	Drive Fault, E-stop
0008H	8	Drive Communication Failure, E-stop
0400H	1024	Synchronization Error, C-stop

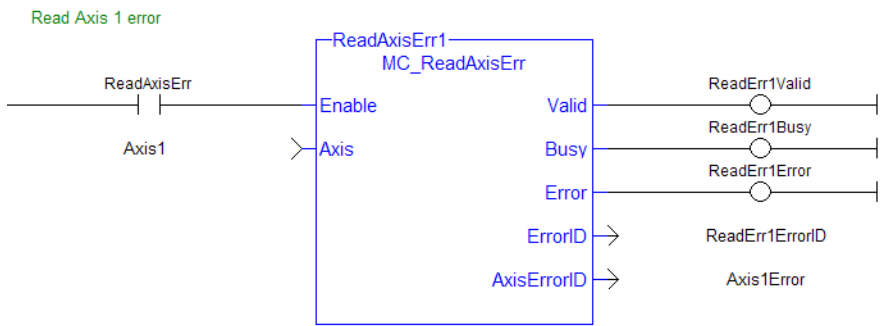

NOTE
 Multiple errors can be active at the same time. For example, if a User-set E-stop and an Excess Position Error E-stop are both active, the value would be 00000011H (17 decimal).

2.2.3.22.5 Example

2.2.3.25 MC_ReadBoolPar

2.2.3.26.1 Description

The MC_ReadBoolPar function block returns the value of the specified Boolean axis parameter.

MC_ReadBoolPar	
Enable	Valid
Axis	Busy
ParameterNumber	Error
	ErrorID
	Value

Figure 1-67: MC_ReadBoolPar

2.2.3.27.2 Arguments**2.2.3.28.3.1 Input**

Enable	Description	Requests to read the Boolean axis parameter
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.)
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
ParameterNumber	Description	Parameter number, see table in Axis Parameters
	Data type	INT
	Range	—
	Unit	n/a
	Default	—

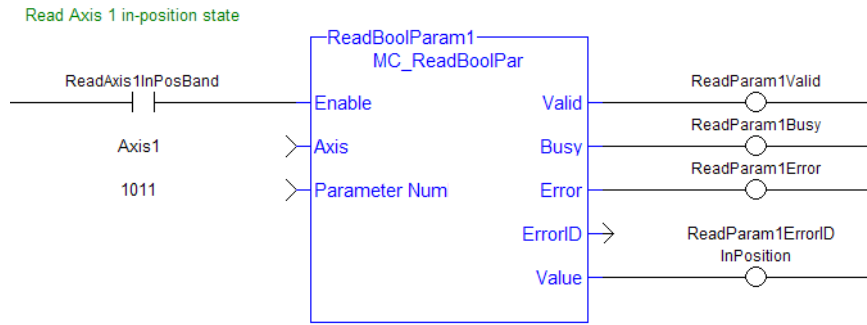

2.2.3.29.4.2 Output

Valid	Description	Indicates the Value output is valid
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT
Value	Description	State of the Boolean parameter
	Data type	BOOL

2.2.3.30.5 Example**2.2.3.31.6.1 Structured Text**

```
(* MC_ReadBoolPar ST example *)
Inst_MC_ReadBoolPar( EnableRead, Axis1, 3 );
//Inst_MC_ReadBoolPar is an instance of MC_ReadBoolPar function block

ParmVal := Inst_MC_ReadParam.Value; //store the Value output into a user
defined variable
```

2.2.3.40.7.2 Ladder Diagram

2.2.3.41 MC_ReadStatus

2.2.3.42.1 Description

The function block MC_ReadStatus returns the state of the specified axis.

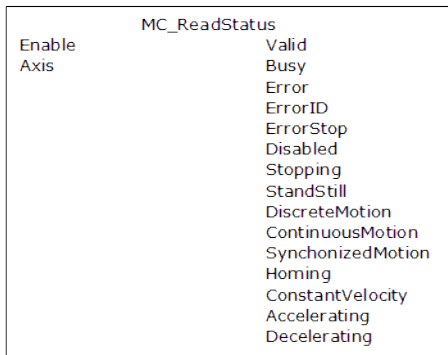

Figure 1-69: MC_ReadStatus

2.2.3.43.2 Arguments

2.2.3.44.3.1 Input

Enable	Description	Requests to read and return the axis status
	Data type	BOOL
	Range	0, 1

	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function. click here...
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

2.2.3.45.4.2 Output

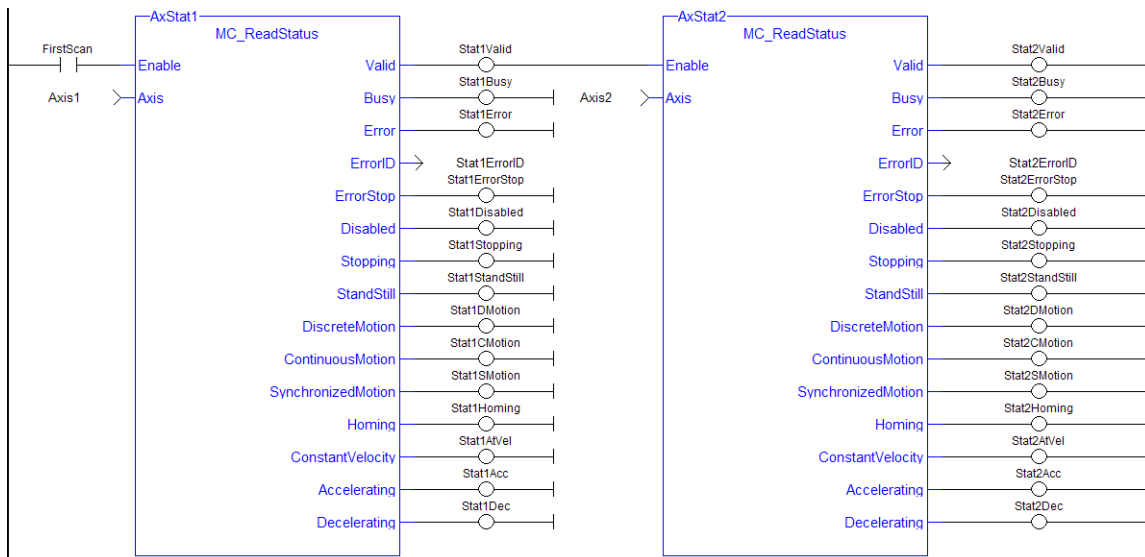

Valid	Description	Indicates the outputs are valid
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT
ErrorStop	Description	Indicates Error Stop state – E-stop or C-stop
	Data type	BOOL
Disabled	Description	Indicates Disabled state – open loop and drive is disabled
	Data type	BOOL
Stopping	Description	Indicates Stopping state – MC_Stop command
	Data type	BOOL
StandStill	Description	Indicates Stand Still state – no move, closed loop, drive enabled
	Data type	BOOL
DiscreteMotion	Description	Indicates Discrete Motion state – programmed endpoint move is active
	Data type	BOOL
ContinuousMotion	Description	Indicates Continuous Motion state – unending, single-axis move is active
	Data type	BOOL
SynchronizedMotion	Description	Indicates Synchronized Motion state – slave move is active
	Data type	BOOL
Homing	Description	Indicates Homing state – a homing cycle is currently executing
	Data type	BOOL
ConstantVelocity	Description	Indicates the axis is moving at a constant velocity
	Data type	BOOL
Accelerating	Description	Indicates the axis is accelerating
	Data type	BOOL
Decelerating	Description	Indicates the axis is decelerating
	Data type	BOOL

2.2.3.46.5 Example

2.2.3.47.6.1 Structured Text

a user defined variable
AxisAccelerating := Inst_MC_ReadStatus.Accelerating; // store Accel-
erating output to a user defined variable
```

2.2.3.48.7.2 Ladder Diagram

2.2.3.49 MC_WriteBoolPar

2.2.3.50.1 Description

The MC_WriteBoolPar function block writes the specified axis Boolean parameter.

2.2.3.51.2 Arguments

2.2.3.52.3.1 Input

Execute	Description	Requests to write a Boolean axis parameter
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
ParameterNumber	Description	Parameter number, see table in Axis Parameters
	Data type	INT
	Range	—
	Default	—

Value	Unit	n/a
	Default	—
	Description	State to write
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

2.2.3.53.4.2 Output

Done	Description	Indicates the Boolean parameter has been written
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.3.54.5 Example

2.2.3.55.6.1 Structured Text

```
(* MC_WriteBoolPar ST example *)
WriteBool := TRUE; //value to write to the boolean parameter #1
Inst_MC_WriteBoolPar( WriteReq, Axis1, 1, WriteBool ); //Inst_MC_
WriteBoolPar is an instance of MC_WriteBoolPar
```

2.2.3.56.7.2 Ladder Diagram

NOTE
Currently, MC_WriteBoolPar does not support any parameters (1050 is an arbitrary number chosen for example)

2.2.3.57 MC_WriteParam

2.2.3.58.1 Description

The MC_WriteParam function block writes the specified axis parameter.

2.2.3.59.2 Arguments

2.2.3.60.3.1 Input

Execute	Description	Requests to write the axis parameter
----------------	--------------------	--------------------------------------

	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
ParameterNumber	Description	Parameter number, see table in Axis Parameters
	Data type	INT
	Range	—
	Unit	n/a
	Default	—
Value	Description	Value to write
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	—

2.2.3.61.4.2 Output

Done	Description	Indicates the parameter has been written
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.3.62.5 Example

2.2.3.63.6.1 Structured Text

```
(* MC_WriteParam ST example *)
WriteValue := 1234.2; //value to write to parameter 1002
Inst_MC_WriteParam( WriteReq, Axis1, 1002, WriteValue); //Inst_MC_
WriteParam is an instance of MC_WriteParam
```

2.2.3.64.7.2 Ladder Diagram

Increment the master offset delta by 24

2.2.4 PLCOpenMotion Functions

This set of functions provides control over an axis.

2.2.4.1 MC_Halt

2.2.4.2.1 Description

This function block decelerates an axis to zero velocity. It is a queued single-axis move. The move is complete when the axis reaches zero velocity. It is typically used with Abort at the BufferMode input to terminate a move. To execute a stop that cannot be aborted, see [MC_Stop](#).

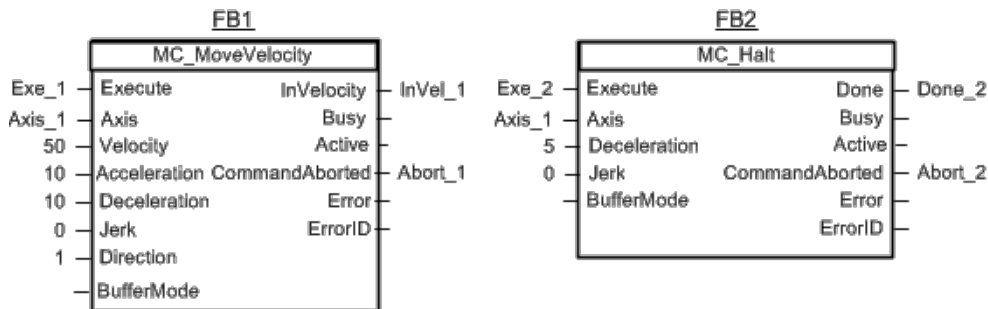

Figure 1-70: MC_Halt

2.2.4.3.2 Time Diagram

The example below shows the behavior in combination with a [MC_MoveVelocity](#).

- A rotating axis is ramped down with FB2 MC_Halt
- Another motion command overrides the MC_Halt command

MC_Halt allows this, in contrast to MC_Stop. The axis can accelerate again without reaching standstill.

2.2.4.4.3 Arguments

2.2.4.5.4.1 Input

Execute	Description	Requests to queue the move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Maximum deceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—
BufferMode	Description	0 = abort 1 = buffer 2 = blend to active 3 = blend to next 4 = blend to low velocity 5 = blend to high velocity

Data type	SINT
Range	[0,5]
Unit	n/a
Default	—

2.2.4.6.5.2 Output

Done	Description	Indicates the move completed successfully. The Command Position has reached the endpoint.
	Data type	BOOL
Busy	Description	High from the moment the Execute input is one-shot to the time the move is ended
	Data type	BOOL
Active	Description	Indicates this move is the active move
	Data type	BOOL
CommandAborted	Description	Indicates this move was aborted
	Data type	BOOL
Error	Description	Indicates an invalid input was specified or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

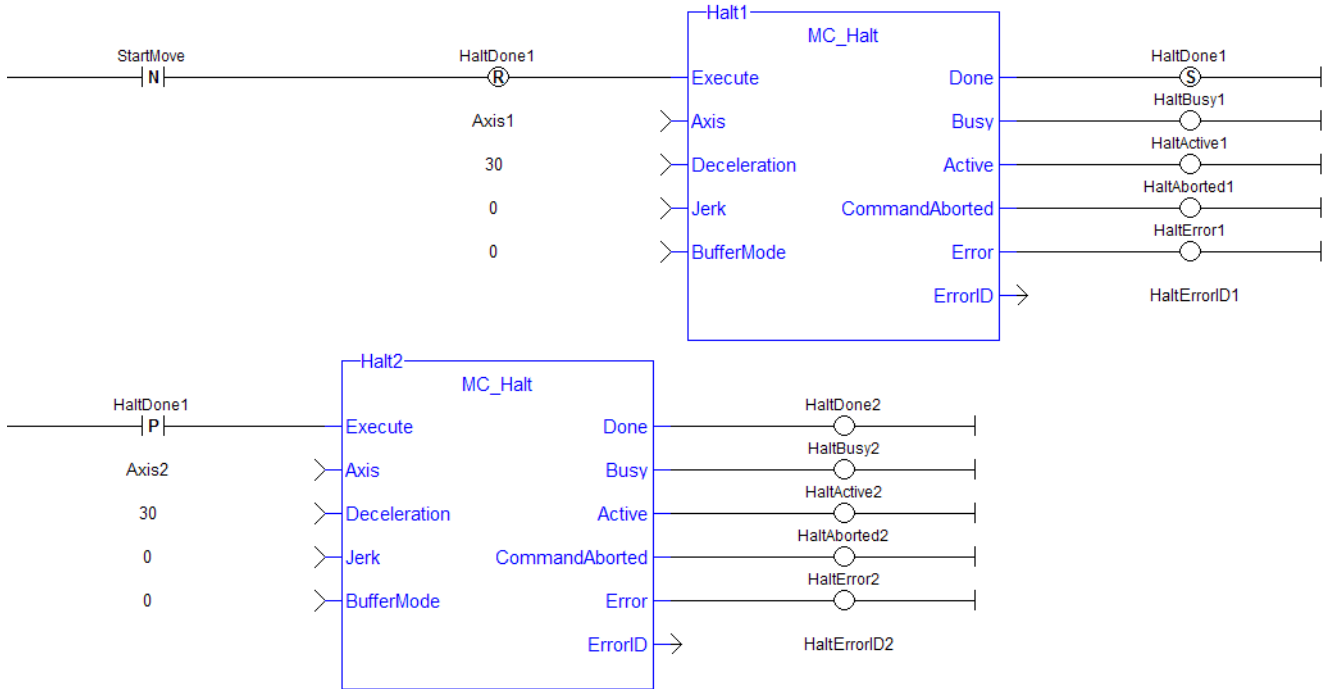

2.2.4.7.6 Example

2.2.4.8.7.1 Structured Text

```
(* MC_Halt ST example *)
Inst_MC_Halt( HaltReq, Axis1,100.0, 100.0, 0 );
//Inst_MC_Halt is an instance of MC_halt function block
HaltComplete := Inst_MC_Halt.Done; //store Done output into user
defined variable
```

2.2.4.9.8.2 Ladder Diagram

Stop both axes when the Run/Stop switch is set to Stop

2.2.4.10 MC_MoveAbsolute

2.2.4.11.1 Description

This function block performs a single-axis move to a specified endpoint position based on Axis, Position, Velocity, Acceleration, Deceleration, Jerk, and Direction parameters.

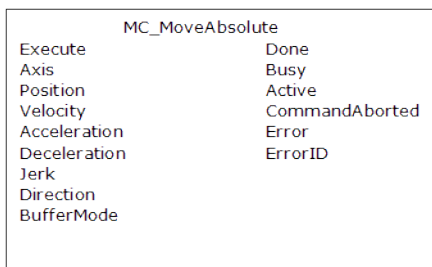

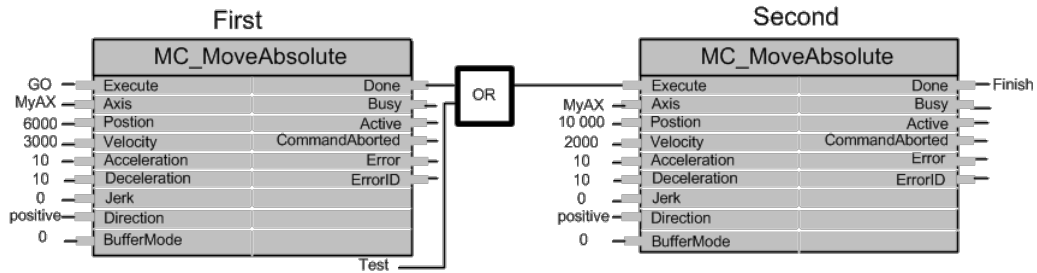

Figure 1-71: MC_MoveAbsolute

2.2.4.12.2 Time Diagram

The following figure shows two examples of the combination of two absolute move Function Blocks:

- The left part of timing diagram illustrates the case if the Second Function Block is called **after** the First one. If First reaches the commanded position of 6000 (and the velocity is 0) then the output Done causes the Second FB to move to the position 10000
- The right part of the timing diagram illustrates the case if the Second move Function Block starts the execution **while** the First FB is still executing. In this case the First motion is interrupted and aborted by the Test signal during the constant velocity of the First FB. The Second FB moves directly to the position 10000 although the position of 6000 is not yet reached

2.2.4.13.3 Arguments

2.2.4.14.4.1 Input

Execute	Description	Requests to queue the move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—

Position	Description	Endpoint position. If Rollover Position is nonzero, this value must be in the range $0 \leq \text{Position} < \text{Rollover Position}$ When not in Rollover mode, the input accepts a 64-bit floating point value. When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$ feedback units.
	Data type	LREAL
	Range	[see Description]
	Unit	User unit
	Default	—
Velocity	Description	Velocity setpoint
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	—
Acceleration	Description	Trapezoidal: Acceleration rate S-curve: Maximum acceleration If Acceleration is not valid, ErrorID is set to 21 Selection of Acceleration and Jerk Parameters for Function Blocks
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Unused
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk If Jerk is not valid, ErrorID is set to 21 Selection of Acceleration and Jerk Parameters for Function Blocks
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—

Direction**Description**

When Rollover Position is zero, a value of 0 must be specified. When Rollover Position is nonzero, a value of 1, 2, 3, or 4 must be specified.

Value	Description
0	no direction specification
1	positive direction. The axis travels in the positive direction to the endpoint
2	shortest distance. The axis travels in the direction that provides the shortest distance to the endpoint
3	negative direction. The axis travels in the negative direction to the endpoint
4	last direction. The axis travels to the endpoint in the same direction as its previous move

If the Position input is the same as the axis's current position, then:

- when Direction = **2** (shortest distance), the axis does not move and the Done output goes high indicating that the move has been completed.
- when Direction = **1, 3, or 4**, the axis travels in the specified direction, through one rollover cycle, and arrives back at the same position.

Data type SINT

Range [0,4]

Unit n/a

Default —

BufferMode**Description**

0 = abort
 1 = buffer
 2 = blend to active
 3 = blend to next
 4 = blend to low velocity
 5 = blend to high velocity

Data type SINT

Range [0,5]

Unit n/a

Default —

2.2.4.15.5.2 Output**Done****Description**

Indicates the move completed successfully. The Command Position has reached the endpoint.

Data type BOOL

Busy**Description**

High from the moment the Execute input is one-shot to the time the move is ended

Data type BOOL

Active**Description**

Indicates this move is the active move

Data type BOOL

CommandAborted**Description**

Indicates the move was aborted

	Data type	BOOL
Error	Description	Indicates an invalid input was specified or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.4.16.6 Example

```
(* MC_MoveAbsolute ST example *)
Inst_MC_MoveAbsolute( MovAbsReq, Axis1, 1234.567, 100.0, 100.0, 100.0, 0,
0, 0 ); //instance of MC_MoveAbsolute
MovAbsDone := Inst_MC_MoveAbsolute.Done; //store done output into user
defined variable
MovAbsBusy := Inst_MC_MoveAbsolute.Busy;
MovAbsActive := Inst_MC_MoveAbsolute.Active;
MovAbsAborted := Inst_MC_MoveAbsolute.CommandAborted;
MovAbsError := Inst_MC_MoveAbsolute.Error;
MovAbsErrID := Inst_MC_MoveAbsolute.ErrorID;
```

2.2.4.18.8.2 Ladder Diagram

2.2.4.19 MC_MoveAdditive

2.2.4.20.1 Description

This function block performs a single-axis move for a specified distance from the endpoint of the previous move. It is typically used with Abort specified at the BufferMode input. If BufferMode is not Abort, this move is identical to an MC_MoveRelative.

MC_MoveAdditive	
Execute	Done
Axis	Busy
Distance	Active
Velocity	CommandAborted
Acceleration	Error
Deceleration	ErrorID
Jerk	
BufferMode	

Figure 1-72: MC_MoveAdditive

2.2.4.21.2 Time Diagram

The following figure shows two examples of the combination of two Function Blocks while the axis is in Discrete Motion state:

- The left part of timing diagram illustrates the case if the Second Function Block is called **after** the First one. If First reaches the commanded distance 6000 (and the velocity is 0) then the output **Done** causes the Second FB to move to the distance 10000
- The right part of the timing diagram illustrates the case if the Second move Function Blocks starts the execution **while** the First FB is still executing. In this case the First motion is interrupted and aborted by the Test signal during the constant velocity of the First FB. The Second FB **adds on the previous commanded position** of 6000 the distance 4000 and moves the axis to the resulting position of 10000

2.2.4.22.3 Arguments

2.2.4.23.4.1 Input

Execute	Description	Requests to queue the move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Axis	Description	Name of a declared instance of the AXIS_REF library function.)
	Data type	AXIS_REF

	Range	[1,256]
	Unit	n/a
	Default	—
Distance	Description	Distance to add to the endpoint of the previous move
	Data type	REAL
	Range	—
	Unit	User unit
	Default	—
Velocity	Description	Velocity setpoint
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	—
Acceleration	Description	Trapezoidal: Acceleration rate S-curve: Maximum acceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Unused
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—
BufferMode	Description	0 = abort 1 = buffer 2 = blend to active 3 = blend to next 4 = blend to low velocity 5 = blend to high velocity
	Data type	SINT
	Range	[0,5]
	Unit	n/a
	Default	—

2.2.4.24.5.2 Output

Done	Description	Indicates the move completed successfully. The Command Position has reached the endpoint.
	Data type	BOOL

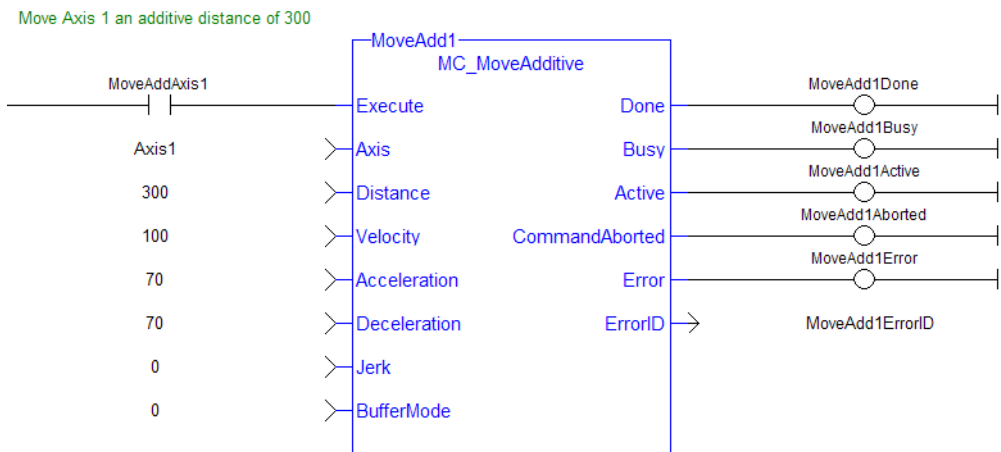

Busy	Description	High from the moment the Execute input is one-shot to the time the move is ended
	Data type	BOOL
Active	Description	Indicates this move is the active move
	Data type	BOOL
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
Error	Description	Indicates an invalid input was specified or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.4.25.6 Example

2.2.4.26.7.1 Structured Text

```
(* MC_MoveAdditive ST example *)
Inst_MC_MoveAdditive( MovAddReq, Axis1, 123.456, 100.0, 100.0, 100.0, 0,

//Inst_MC_MoveAdditive is an instance of MC_MoveAdditive function
block
MovAddDone := Inst_MC_MoveAdditive.Done;
//store Done output into user defined variable
```

2.2.4.27.8.2 Ladder Diagram

2.2.4.28 MC_MoveRelative

2.2.4.29.1 Description

This function block executes a single-axis move for a specified distance to perform incremental motion.

MC_MoveRelative	
Execute	
Axis	Busy
Distance	Active
Velocity	CommandAborted
Acceleration	Error
Deceleration	ErrorID
Jerk	
BufferMode	

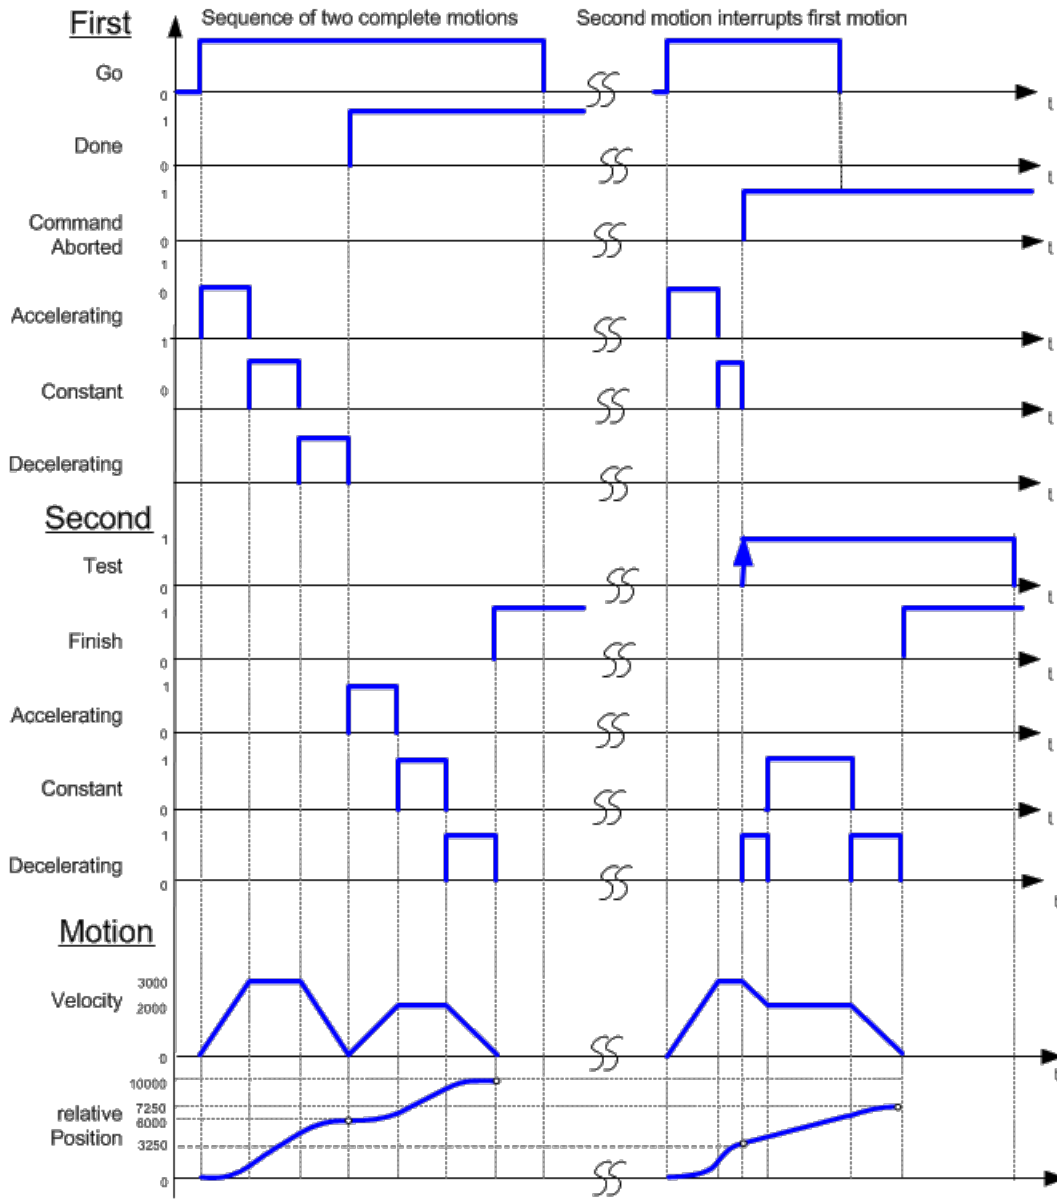

Figure 1-73: MC_MoveRelative

2.2.4.30.2 Time Diagram

The following figure shows the example of the combination of two relative move Function Blocks:

- The left part of timing diagram illustrates the case if the Second Function Block is called **after** the First one. If First reaches the commanded distance 6000 (and the velocity is 0) then the output **Done** causes the Second FB to move to the distance 10000
- The right part of the timing diagram illustrates the case if the Second move Function Blocks starts the execution **while** the First FB is still executing. In this case the First motion is interrupted and aborted by the Test signal during the constant velocity of the First FB. The Second FB **adds on the actual position** of 3250 the distance 4000 and moves the axis to the resulting position of 7250

2.2.4.31.3 Arguments

2.2.4.32.4.1 Input

Execute	Description	Requests to queue the move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
Distance	Description	Distance

	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—
Velocity	Description	Velocity setpoint
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	—
Acceleration	Description	Trapezoidal: Acceleration rate S-curve: Maximum acceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Unused
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—
BufferMode	Description	0 = abort 1 = buffer 2 = blend to active 3 = blend to next 4 = blend to low velocity 5 = blend to high velocity
	Data type	SINT
	Range	[0,5]
	Unit	n/a
	Default	—

2.2.4.33.5.2 Output

Done	Description	Indicates the move completed successfully. The Command Position has reached the endpoint.
	Data type	BOOL
Busy	Description	High from the moment the Execute input is one-shot to the time the move is ended
	Data type	BOOL
Active	Description	Indicates this move is the active move

CommandAborted	Data type	BOOL
	Description	Indicates the move was aborted
Error	Data type	BOOL
	Description	Indicates an invalid input was specified or the move was terminated due to an error
ErrorID	Data type	BOOL
	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

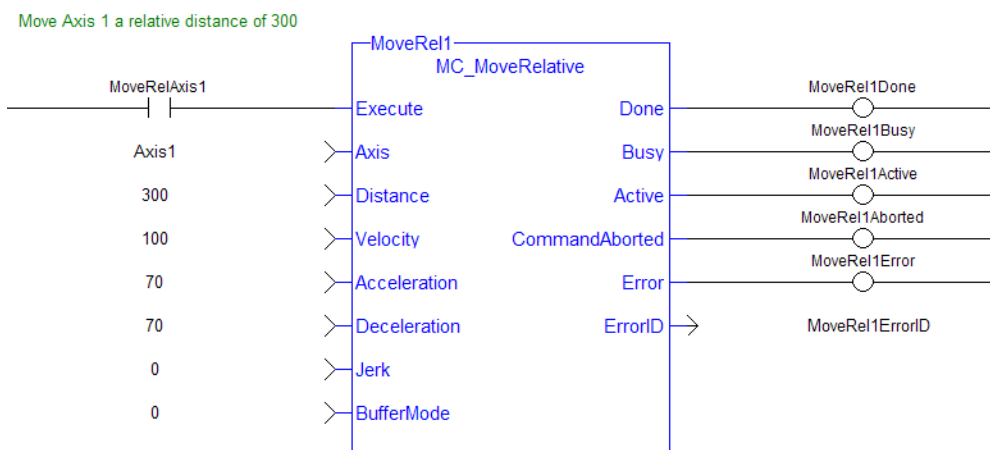

2.2.4.34.6 Example

2.2.4.35.7.1 Structured Text

```
(* MC_MoveRelative ST example *)
Inst_MC_MoveRelative( MovRelReq, Axis1, 10.0, 200.0,150.0, 150.0, 0,0 );
MovRelDone := Inst_MC_MoveRelative.Done; //store Done output into user
defined variable
```

See also how this function is used in the Hole punch project [here](#)

2.2.4.36.8.2 Ladder Diagram

2.2.4.37 MC_MoveSuperimp

2.2.4.38.1 Description

This function block provides the ability to cause additional axis motion superimposed upon a currently executing move. A superimposed move is executed like an "MC_MoveRelative" (→ p. 341) move using the specified **Distance**, **Velocity** (i.e. VelocityDiff), **Acceleration**, **Deceleration**, and **Jerk** values. The interpolated command generated by a superimposed move is added to the command of the currently executing move. Subsequent calls to MC_MoveSuperimp can abort or blend to an executing MC_MoveSuperimp move.

This function block provides a way to smoothly apply a shift in axis position while it is executing a move.

Figure 1-74: MC_MoveSuperimp

2.2.4.39.2 Time Diagram

NOTE

1. The CommandAborted is not visible here, because the new command works on the same instance
2. The end position is between 7000 and 8000, depending on the timing of the aborting of the second command set for the MC_MoveSuperimposed

2.2.4.40.3 Arguments

2.2.4.41.4.1 Input

Execute	Description	Requests to queue the superimposed move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]

	Unit	n/a
	Default	—
Distance	Description	Distance
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—
VelocityDiff	Description	Velocity rate
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	—
Acceleration	Description	Trapezoidal: Acceleration rate S-curve: Maximum acceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Unused
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—
BufferMode	Description	0. abort 1. buffer 2. blend to active 3. blend to next 4. blend to low velocity 5. blend to high velocity
	Data type	SINT
	Range	[0,5]
	Unit	n/a
	Default	—

2.2.4.42.5.2 Output

Done	Description	Indicates the move completed successfully. The Command Position has reached the endpoint.
	Data type	BOOL

Busy	Description	High from the moment the Execute input is one-shot to the time the move is ended
	Data type	BOOL
Active	Description	Indicates this move is the active superimposed move
	Data type	BOOL
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
Error	Description	Indicates an invalid input was specified or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

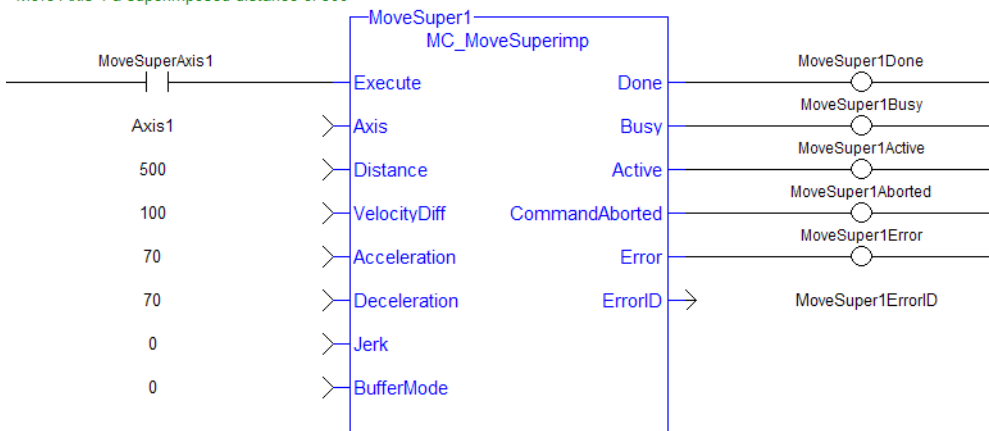

2.2.4.43.6 Example

2.2.4.44.7.1 Structured Text

```
(* MC_MoveSuperimp ST example *)
Inst_MC_MoveSuperimp( MovSupReq, Axis1, 123.555, 10.0, 100.0, 100.0, 0, 0

2.2.4.46 MC_MoveVelocity

2.2.4.47.1 Description

This function block performs a single-axis non-ending move at a specified velocity. This type of move can be terminated with the MC_Halt function block or by aborting it with another move.

MC_MoveVelocity	
Execute	InVelocity
Axis	Busy
Velocity	Active
Acceleration	CommandAborted
Deceleration	Error
Jerk	ErrorID
Direction	
BufferMode	

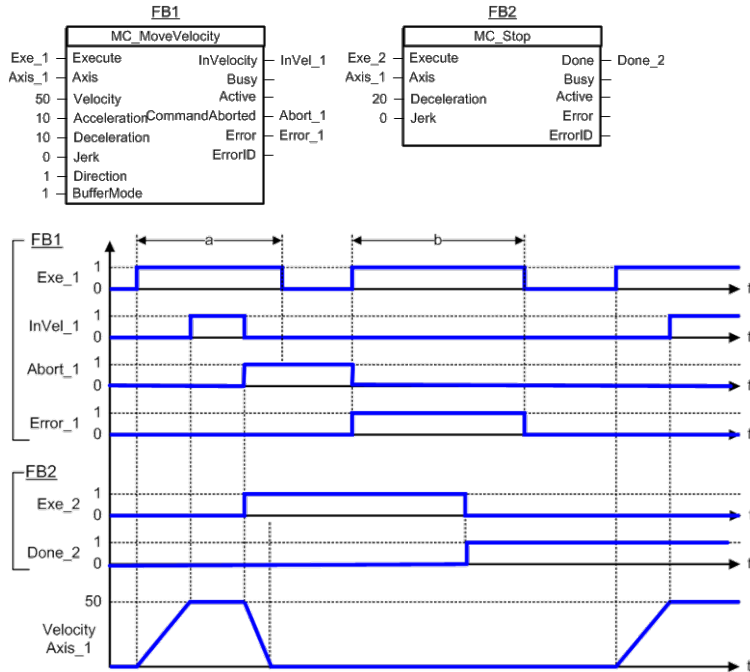

Figure 1-75: MC_MoveVelocity

2.2.4.48.2 Time Diagram

The example below shows the behavior of the combination of a [MC_Stop](#) FB with a MC_MoveVelocity FB.

- A rotating axis is ramped down with FB2 MC_Stop
- The axis rejects motion commands as long as MC_Stop parameter “Execute” = TRUE

FB1 MC_MoveVelocity reports an error indicating the busy MC_Stop command.

2.2.4.49.3 Arguments

2.2.4.50.4.1 Input

Execute	Description	Requests to queue the move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
Velocity	Description	Velocity rate
	Data type	LREAL
	Range	—
	Unit	User unit/sec

2.2.4.55 MC_SetOverride

2.2.4.56.1 Description

This function block writes the velocity override factor. A change in the velocity override factor takes effect immediately on the active move.

The velocity override factor is applied to the programmed velocity (of a "MC_MoveAbsolute" (→ p. 334), "MC_MoveAdditive" (→ p. 338), "MC_MoveRelative" (→ p. 341), "MC_MoveSuperimp" (→ p. 345), or "MC_MoveVelocity" (→ p. 348) function block) to determine the command velocity:

$$\text{command velocity} = \text{programmed velocity} * \text{VelFactor}$$

Figure 1-76: MC_SetOverride

2.2.4.57.2 Arguments

2.2.4.58.3.1 Input

Enable	Description	Request to write the override factors
	Data type	BOOL
	Range	0, 1
	Unit	n/a

Axis	Default	—
	Description	Name of a declared instance of the AXIS_REF library function.
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
VelFactor	Default	—
	Description	Velocity override factor
	Data type	REAL
	Range	[0.0, 2.0]
	Unit	n/a
	Default	—

2.2.4.59.4.2 Output

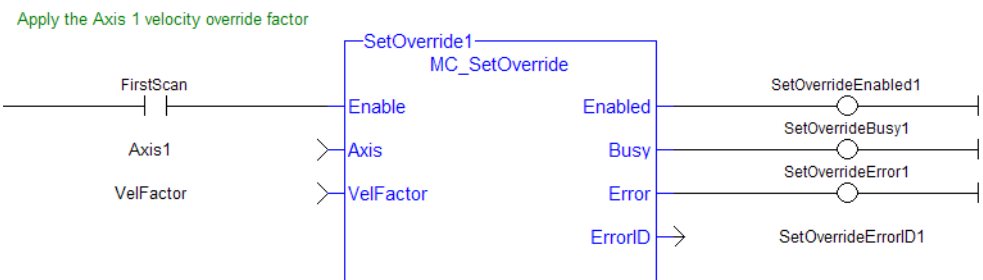

Enabled	Description	Indicates the override values have been written
	Data type	BOOL
Busy	Description	Indicates the function block is executing
	Data type	BOOL
Error	Description	Indicates an invalid input is specified
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.4.60.5 Example

2.2.4.61.6.1 Structured Text

```
(* MC_SetOverride ST example *)
VelFactor := 1.25 ; //set the velocity factor to 1.25 (125%)
Inst_MC_SetOverride( TRUE , Axis1, VelFactor ); // Inst_MC_Setoverride is
an instance of MC_SetOverride
```

2.2.4.62.7.2 Ladder Diagram

2.2.5 Profile Functions

This set of functions provides commands for slave axes, such as cams and gearing.

2.2.5.1 MC_CamIn

2.2.5.2.1 Description

This function block performs a slave axis move which follows the master axis based on the Cam Table specified by CamTableID.

This function block is used to either initiate a new MC_CamIn move or to resume a previously programmed MC_CamIn move. Refer to "MC_CamStartPos" (→ p. 363) and "MC_CamResumePos" (→ p. 361) for information on positioning the slave axis prior to calling MC_CamIn.

Figure 1-77: MC_CamIn

2.2.5.3.2 Arguments

2.2.5.4.3.1 Input

Execute	Description	Requests to queue the CamIn move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Master	Description	Name of a declared instance of the AXIS_REF library function
	Data type	AXIS_REF
	Range	1 - 256
	Unit	n/a
Slave	Description	AXIS_REF.AXIS_NUM is the slave axis number
	Data type	AXIS_REF
	Range	1-256
	Unit	n/a
MasterOffset	Description	Profile shift along the master axis. This input is not used if the StartMode input is set to 1 for Resume Mode.
	Data type	LREAL
	Range	—
	Unit	User unit
SlaveOffset	Description	Profile shift along the slave axis. This input is not used if the StartMode input is set to 1 for Resume Mode.
	Data type	LREAL
	Range	—

	Unit	User unit
MasterScaling	Description	Master axis profile range. This input is not used if the StartMode input is set to 1 for Resume Mode. Scaling must be a positive value that is greater than 0.
	Data type	LREAL
	Range	—
	Unit	User unit
SlaveScaling	Description	Slave axis profile range. This input is not used if the StartMode input is set to 1 for Resume Mode. Scaling must be a positive value that is greater than 0.
	Data type	LREAL
	Range	—
	Unit	User unit
Startmode	Description	Starting mode of the cam profile. 0 = Start Mode. Start a cam profile move. 1 = Resume Mode. Resume the most recent MC_CamIn move. This input indicates whether the axis should start a MC_CamIn move as an initial cam start (StartMode = 0) or if the axis should resume the most recently programmed MC_CamIn move (StartMode = 1). It should be noted that in the case of Resume Mode (StartMode = 1) that the inputs MasterOffset, SlaveOffset, MasterScaling, and SlaveScaling are not used. The function block will use the values that were in effect during the most recently programmed MC_CamIn move for the slave axis.
	Data type	INT
	Range	[0,1]
	Unit	n/a
CamTableID	Description	ID number of the profile to be used with MC_CamIn
	Data type	INT
	Range	—
	Unit	n/a
BufferMode	Description	Buffer mode for CamIn block.
	Data type	SINT
	Range	0-5
	Unit	n/a

2.2.5.5.4.2 Output

InSync	Description	Indicates the slave axis is in sync with the profile
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Busy	Description	Indicates this function block is executing
	Data type	BOOL
	Range	0, 1

	Unit	n/a
Active	Description	Indicates this move is the Active move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Error	Description	Indicates an invalid input, or the move was terminated due to an error
	Data type	BOOL
	Range	0, 1
	Unit	n/a
ErrorID	Description	Indicates the error if the Error output is high.
	Data type	INT
	Range	—
	Unit	n/a
EndOfProfile	Description	Indicates the end of profile has been reached. If the profile is periodic this output is set to ON for one ladder scan. If the profile is not periodic, the output remains ON while outside the range of the profile.
	Data type	BOOL
	Range	0, 1
	Unit	n/a

2.2.5.6.5 Usage

The slave axis immediately locks on to the Cam Table profile.

The **Master Offset** is used to shift the profile along the master axis.

The **Master Scaling** defines the range of the profile along the master axis.

The **Slave Offset** is used to shift the profile along the Slave axis.

The **Slave Scaling** defines the range of the profile along the slave axis.

If the profile is periodic, when the end of profile reached, the profile continues at the start of the profile. The EndOfProfile output is ON for 1 ladder scan.

If the profile is not periodic, when the end of profile is reached, the slave axis stops and remains at the end of the profile until the master axis returns to within the profile range as defined by MasterScaling. The EndOfProfile output remains ON anytime the master axis is outside of the profile range.

Adjustments computation is done as follows:

When cam is first started, offsets are adjusted if necessary

- If slave is not absolute, then slave offset = slave offset + starting position
- If master is not absolute, then master offset = master offset + starting position.

At run-time

- Master position for profile = master position - master offset
- Use master position for profile table to obtain slave profile position
- Slave commanded position = slave profile position + slave offset

2.2.5.7.6 Related Functions

"MC_CamResumePos" (→ p. 361)

"MC_CamStartPos" (→ p. 363)

[MC_CamTblSelect](#)

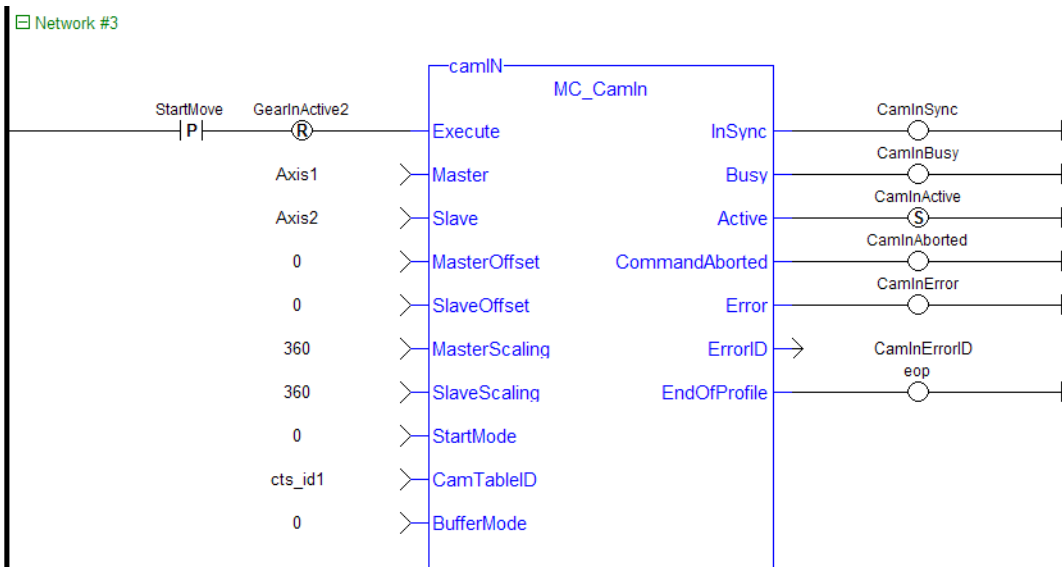

[MC_CamOut](#)

2.2.5.8.7 Examples

2.2.5.9.8.1 Structured Text

```
(* MC_CamIn ST example *) //Inst_MC_CamIn is an instance of MC_CamIn
Inst_MC_CamIn( CamStartBool, Axis1, Axis2, 0.0, 0.0, 360.0, 360.0, 0,
CamTableID, 0 );
```

2.2.5.10.9.2 Ladder Diagram

The three following examples utilizes the screen shot below showing the cam profile “MyProfile”

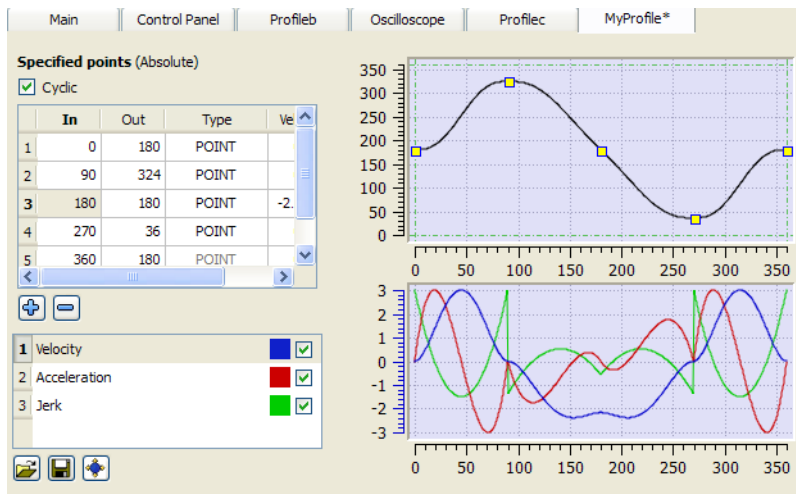

Figure 1-78: MC_CamIn examples

2.2.5.11.10.3 Example 1

Profile	MyProfile
Cycle	NO
MasterAbsolute	YES
SlaveAbsolute	YES
MasterOffset	0.0
SlaveOffset	0.0
MasterScaling	360.0
SlaveScaling	360.0
Initial Master position	0.0
Initial Slave position	180.0

After `MC_CamTblSelect` and `MC_CamIn` are programmed with the above parameters, the slave axis is locked on to the profile. Since both have zero offsets, the profile is not shifted in either axis. The initial condition of the master axis at position 0, yields a slave command position of 180.0. As the master axis moves positive, the slave position follows the profile. When the master position is at 90.0, the slave is commanded to 324.0 (see curve below where in = 90, out = 324). The slave follows the profile as the master axis moves until the master axis reaches a position of 360.0. At this time the slave is commanded to 180.0.

If the master were to continue to move past 360.0 the slave commanded position would remain at 180.0 since the Cyclic input is false. If the master moves negative and its position returns to less than 360.0, then the slave follows the profile again.

2.2.5.12.11.4 Example 2

Profile	MyProfile
Cycle	YES
MasterAbsolute	NO
SlaveAbsolute	NO
MasterOffset	0.0
SlaveOffset	0.0
MasterScaling	360.0
SlaveScaling	360.0
Initial Master position	180
Initial Slave position	90.0

After `MC_CamTblSelect` and `MC_CamIn` are programmed with the above parameters, the slave axis is locked on to the profile. Since the both axes have zero offsets, the profile is not shifted in either axis. Neither the *MasterAbsolute* nor *SlaveAbsolute* input is on, so the profile is relative to the axes initial positions. Specifically, the initial condition of the master axis at position 180 would represent a master profile position of 0 (180-180). This yields a slave command position of 270 (180 + 90). As the master axis moves positive, the slave position follows the profile. When the master position is at 270, the slave is commanded to 414.0 (324 + 90). The slave follows the profile as the master axis moves until the master axis reaches a position of 540. At this time the slave is commanded to 270.0 (180 + 90).

If the master continues to move past 540.0, the slave commanded position follows the profile from the beginning since the Cyclic input is TRUE. When the master reaches a position of 630, the slave is commanded to a position of 414.0 (324 + 90).

2.2.5.13.12.5 Example 3

Profile	MyProfile
Cycle	NO
MasterAbsolute	YES
SlaveAbsolute	YES
MasterOffset	90
SlaveOffset	-180
MasterScaling	360.0
SlaveScaling	360.0
Initial Master position	180
Initial Slave position	144

After `MC_CamTblSelect` and `MC_CamIn` are programmed with the above parameters, the slave axis is locked on to the profile. Since the both axes have offsets, the profile is shifted along both axes. Specifically the master axis is shifted 90, and the slave axis is shifted -180. Initially the master axis position of 180 yields a master position for the profile calculation of 90 (master position 180 - Master offset 90), which yields a slave command position of 144 (slave profile command 324 + slave offset (-180)). As the master axis moves positive, the slave position follows the profile. When the master axis position is at 270, the master position for profile calculation is 180 (270 - 90). This yields a slave command position of 0 (180 + (-180)).

The slave follows the profile as the master axis moves until the master axis reaches a position of 450. The master axis position of 450 yields a master position for profile calculation of 360 (450 - 90). The slave command position is 0 (180 + (-180)).

When the master reaches a position of 450, the slave commanded position remains at 0 since the Cyclic input is false.

2.2.5.14 MC_CamOut

2.2.5.15.1 Description

This function block:

- aborts the active MC_CamIn move
- disengages the axis from its master
- and commands the axis to continue at its current velocity

Like a MC_MoveVelocity move, the control continues to command the axis to move at this velocity until this MC_CamOut move is aborted. If this function block is called and the active move is not a MC_CamIn move, this function block returns an error and the active move is not aborted.

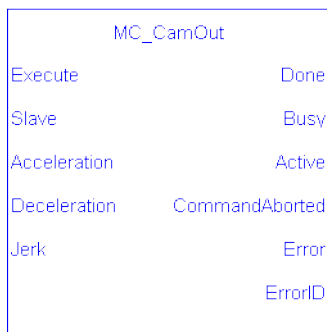

Figure 1-79: MC_CamOut

2.2.5.16.2 Arguments

2.2.5.17.3.1 Input

Argument	Description	Default
Execute	Description	Requests to queue the CamOut move
	Data type	BOOL

	Unit	n/a
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
	Range	0, 1
	Unit	n/a
Error	Description	Indicates an invalid input was specified or no MC_CamIn move was active
	Data type	BOOL
	Range	0, 1
	Unit	n/a
ErrorID	Description	Indicates the error if the Error output is high
	Data type	INT
	Range	—

Unit n/a

2.2.5.19.5 Usage

This function block disengages the slave axis from a MC_CamIn move and then leaves the axis running at its current velocity. The axis continues to run at this velocity until this move is aborted.

2.2.5.24 MC_CamResumePos

2.2.5.25.1 Description

This function block returns the slave axis position for the most recently executed "MC_CamIn" (→ p. 352) profile, based on the current position of the master axis. This slave axis position can be used to command the slave axis to return to the proper location prior to resuming a MC_CamIn function. When calculating the slave axis position, MC_CamResumePos will utilize the master offset, slave offset, master scaling, and slave scaling of the most recently executed MC_CamIn function block for the slave axis.

The typical application of MC_CamResumePos is to aid in returning a slave axis back to its profile position after an event (e.g. E-stop) caused the slave axis to go off path. See Resuming Camming After an E-Stop for complete instructions.

	Data type	INT
	Range	—
	Unit	n/a
CamTableID	Description	Indicates the ID number of the profile to be used with MC_CamIn
	Data type	INT
	Range	0 - 255
	Unit	n/a

2.2.5.50.5 Usage

- Each positive transition of the **Enable** input will create a unique Cam ID and store the profile information in a table. The number of unique Cam IDs is limited to 256. If the application attempts to create more than 256 Cam IDs, the **Error** output will be true and the **ErrorID** output will be 22 (*Too Many Profiles*). It is only necessary to call MC_CamTblSelect once for each Profile/Periodic/MasterAbsolute/SlaveAbsolute configuration to be used.

- The **Periodic** input selects if the profile is to repeat each cycle. If the profile is not periodic and the master axis moves beyond the profile range, the slave stops at the end of the profile.

NOTE

If the master axis moves back into the profile range, the slave resumes following the profile.

- If the **MasterAbsolute** input is ON, the profile is in reference to the Master axis position. If the MasterAbsolute input is OFF, the profile is in reference to the Master axis position at the time the MC_CamIn function block is executed.
- Similarly, the **SlaveAbsolute** input selects if the slave positions are in reference to the Slave axis position or the Slave axis position at the time the MC_CamIn function block is executed.

TIP

If the SlaveAbsolute input is set to TRUE, the axis jumps back to the starting position. If you set this input to FALSE, the axis will no longer jump back; but rather, as the profile repeats, the slave moves relative to the start of each period.

2.2.5.55 MC_GearIn

2.2.5.56.1 Description

This function block performs a slave axis move which follows the master axis based on the ratio specified by RatioNumerator and RatioDenominator.

$$\text{SlaveCommandPosition} = \text{MasterActualPosition} * \text{RatioNumerator} / \text{RatioDenominator}$$

When this command is executed, the slave axis accelerates or decelerates (using the Acceleration, Deceleration, and Jerk) to the target velocity determined by the master axis velocity and the ratio. When the slave axis reaches a velocity within the [“In Gear” bandwidth](#) around the target velocity, it locks on to the master, and the InGear output goes high. When the slave is locked to the master, the slave motion is no longer affected by the acceleration, deceleration, and jerk inputs.

For example if the “In Gear” bandwidth is set to 0.1 User Units per second, the InGear output will turn on if the slave velocity is within +/- 0.1 User Units per second of the target velocity.

The slave axis then continues to follow the master axis until this move is aborted.

Time to Reach the Target Velocity

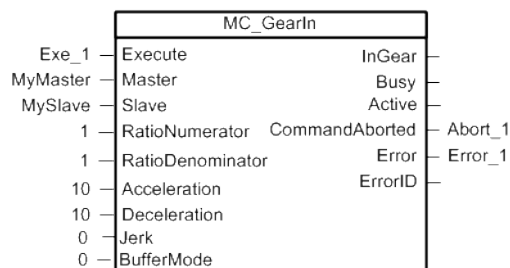

While following the master, gearing functions can generate large accelerations. If the gearing function is aborted while the axis is currently accelerating, and the aborting function block has small non-zero Jerk or small acceleration values, it can take a long time to reach the target velocity, or position of the aborting function block. If the Jerk and/or acceleration of the aborting function cannot be increased to suitable values, it may be desirable to:

- Abort the gearing function with an [MC_GearOut](#) with higher accelerations and/or Jerk values (or zero jerk value),
- Execute the next MC motion function block.

See also how this function is used in the Hole punch project [here](#)

2.2.5.63.8.2 Ladder Diagram

2.2.5.64 MC_GearInPos

2.2.5.65.1 Description

This function block performs a slave axis move which follows the master axis based on the ratio specified by RatioNumerator and RatioDenominator.

```
SlaveCommandPosition = MasterActualPosition * RatioNumerator / RatioDe-
nominator
```

This function block also allows the application to specify sync positions for the master and slave axes. It is the point in which the master and slave axes become engaged in synchronous motion. When the master axis reaches the MasterStartDistance from the MasterSyncPosition, the slave axis begins to accelerate to the target velocity determined by the master axis velocity and the ratio. The slave axis arrives at the target velocity and the SlaveSyncPosition at the same time the master axis arrives at the MasterSyncPosition. At that time, the slave is locked on to the master and follows the master at the ratio specified. The slave axis continues to follow the master axis until this move is aborted.

Time to Reach the Target Velocity

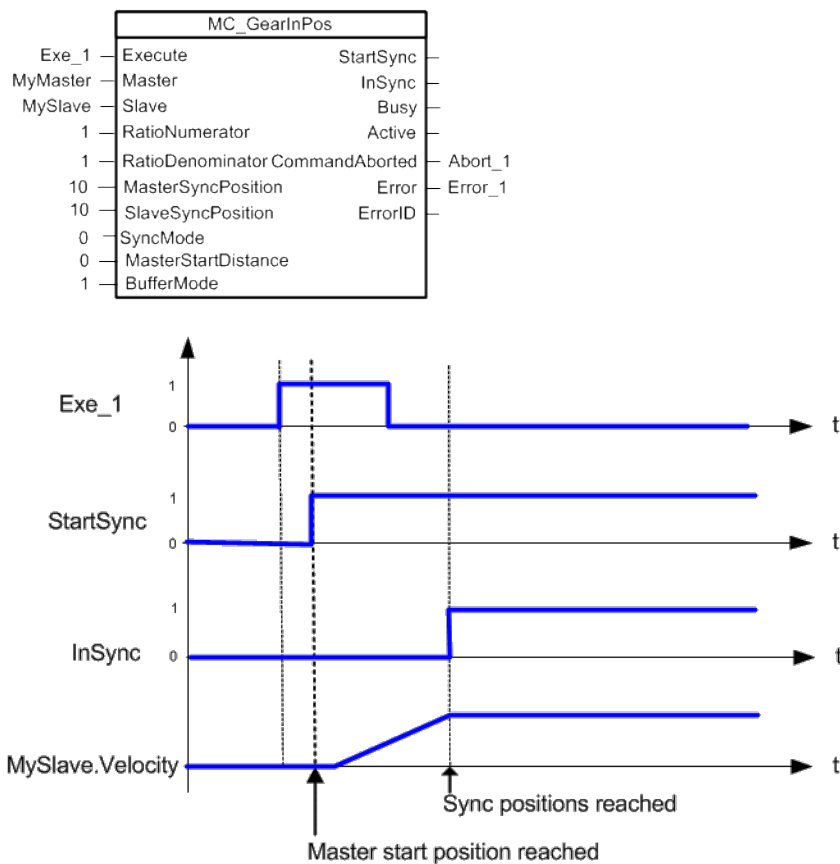

While following the master, gearing functions can generate large accelerations. If the gearing function is aborted while the axis is currently accelerating, and the aborting function block has small non-zero Jerk or small acceleration values, it can take a long time to reach the target velocity, or position of the aborting function block. If the Jerk and/or acceleration of the aborting function cannot be increased to suitable values, it may be desirable to:

- Abort the gearing function with an [MC_GearOut](#) with higher accelerations and/or Jerk values (or zero jerk value),
- Execute the next MC motion function block.

	Default	—
	Description	Slave axis sync position
	Data type	LREAL
	Range	-1.7^{308} to 1.7^{308} (14 to 15 significant digits of accuracy)

SyncMode**Description**

SyncMode determines the allowed conditions for synchronization:

0 = Normal synchronization. Prior to executing the MC_GearInPos function block, the *Master* axis position must be before the *MasterSyncPosition* by a distance greater than the *MasterStartDistance*. The *Slave* axis position must be before the *SlaveSyncPosition*.

In the case of axes that have a non-zero rollover, the MC_GearInPos function block will always assume the axes meet these conditions by assuming the sync point is in the next occurrence of the sync position. *MasterStartDistance* must be positive and greater than the distance the master axis is currently moving per axis update. If the master start distance and the slave axis distance from the *SlaveSyncPosition* are sufficiently large enough, the slave axis will ramp to the sync position. If not sufficiently large enough, acceleration of the slave axis may be excessive.

1 = Immediate synchronization allowed. This mode is only allowed if both the master and slave axes have rollover = 0. If the conditions of SyncMode = 0 are not met, Synchronization is allowed even though the axis positions may be beyond their respective Sync Positions. The *MasterStartDistance* may be 0. If the *MasterStartDistance* is zero, the *Slave* axis will synchronize with the master the instant the master axis crosses the *MasterSyncPosition*.

If either the master or slave axis are beyond their respective sync start positions, the slave axis will immediately synchronize to the master axis. If the master start distance and the slave axis distance from the *SlaveSyncPosition* are sufficiently large enough, the slave axis will ramp to the sync position. If not sufficiently large enough or immediate synchronization occurs, slave axis acceleration may be excessive.

Excessive slave acceleration may also occur if the master axis velocity is large or the master and slave axes have disproportionately different distances to their respective sync positions. If the slave axis is ahead of the master axis at the time of synchronization, the slave axis will move backwards.

Data type INT

Range 0-1

Unit n/a

Default —

MasterStartDistance**Description**

When the master axis reaches this distance before *MasterSyncPosition*, the slave axis begins its lock-on process

Data type LREAL

Range 1.7^{-308} to 1.7^{308} (14 to 15 significant digits of accuracy)

Unit User unit

2.2.5.69.5.2 Output

StartSync	Description	Indicates that the master axis has reached the Master-StartDistance from the MasterSyncPosition and the lock-on process has begun
	Data type	BOOL
InSync	Description	Indicated the slave axis is locked on to the master axis
	Data type	BOOL
Busy	Description	High from the moment the Execute input goes high until the time the move is ended
	Data type	BOOL
Active	Description	Indicates this move is the Active move
	Data type	BOOL
CommandAborted	Description	Indicates the move was aborted. If the abort arises because the inputs cause inconsistent motion, then this FB: <ul style="list-style-type: none"> • performs no motion • sets an error flag • set the ErrorID to 13
	Data type	BOOL
Error	Description	Indicates an invalid input was specified or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.5.70.6 Example**2.2.5.71.7.1 Example Description**

- Master and Slave are rotary axes with rollovers at 360 degrees.
- The Master initial position is 90 degrees and the slave initial position is 45 degrees.
- The GearInPos FB commands the slave to accelerate up to the geared ratio (1:1) during the master start distance (45 degrees) and be synchronized with the master at the master and slave sync positions.

Inst_MC_GearInPos( GearInPosReq, Axis1, Axis2, 2, 1, 0, 0, 0, 100.0, 1 );
//Inst_MC_GearInPos is instance of MC_GearInPos
GearInPosSync:= Inst_MC_GearInPos.InSync;
//store InSync output into user defined variable
```

2.2.5.73.9.3 Ladder Diagram

2.2.5.74 MC_GearOut

2.2.5.75.1 Description

This function block:

- aborts the active MC_GearIn or MC_GearInPos move,
- disengages the axis from its master,
- and commands the axis to continue at its current velocity.

Like a [MC_MoveVelocity](#) move, the control continues to command the axis to move at this velocity until this MC_GearOut move is aborted. The Acceleration, Deceleration and Jerk input parameters are applied if this command velocity is modified by the [MC_SetOverride](#) function block. If this function block is called and the active move is not a [MC_GearIn](#) or [MC_GearInPos](#) move, this function block returns an error and the active move is not aborted.

NOTE

The MC_GearOut is done when the slave axis is disengaged from the master axis. Once done, the MC_GearOut will remain busy and active until it is aborted by a different motion function block. This is different behavior than most other motion function blocks. The MC_GearOut function block represents an exception to the exclusivity rule as the **Done** and **Active** outputs may be true at the same time.

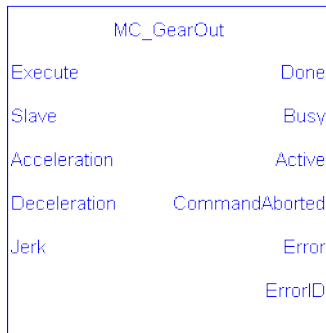

Figure 1-84: MC_GearOut

2.2.5.76.2 Arguments

2.2.5.77.3.1 Input

Execute	Description	Requests to disengage the slave axis from a MC_GearIn or MC_GearInPos move
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Slave	Description	Name of a declared instance of the AXIS_REF library function
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
Acceleration	Description	Trapezoidal: Acceleration rate S-curve: Maximum acceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Unused
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—

2.2.5.78.4.2 Output

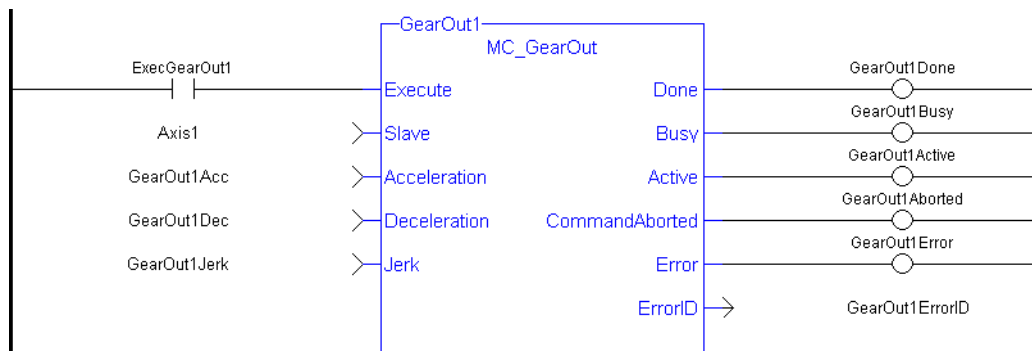

Done	Description	Indicates the axis is disengaged from its master
	Data type	BOOL
Busy	Description	Indicates the function is executing
	Data type	BOOL
Active	Description	Indicates this move is the Active move
	Data type	BOOL
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
Error	Description	Indicates an invalid input was specified or no MC_GearIn or MC_GearInPos move is active
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.5.79.5 Example

2.2.5.80.6.1 Structured Text

```

//Inst_MC_GearOut is instance of MC_GearOut
```

2.2.5.81.7.2 Ladder Diagram

2.2.5.82 MC_Phasing

2.2.5.83.1 Description

The MC_Phasing function block performs a master position phase shift for a slave axis. The distance entered at the **PhaseShift** input is iterated into the Slave axis's Master Offset. This distance is iterated like a "MC_MoveRelative" (→ p. 341) move using the specified **Velocity**, **Acceleration**, **Deceleration**, and **Jerk** values. The difference is that the interpolated command delta is not commanded to the axis but is, instead, added to the Slave axis's Master Offset. This will shift the Master axis's position as viewed by the Slave axis, causing a change in the Slave axis's physical position. This will only affect the Slave axis if it is executing a slave move. Subsequent calls to MC_Phasing can abort or blend to an executing MC_Phasing command.

This function block provides a way to smoothly apply a master offset instead of writing values directly to the Master Offset Parameter 1002.

MC_Phasing	
Execute	Done
Master	Busy
Slave	Active
PhaseShift	CommandAborted
Velocity	Error
Acceleration	ErrorID
Deceleration	
Jerk	
BufferMode	

Figure 1-85: MC_Phasing

2.2.5.84.2 Arguments

2.2.5.85.3.1 Input

Execute	Description	Requests to queue the phase shift
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Master	Description	Name of a declared instance of the AXIS_REF library function.)
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
Slave	Description	AXIS_REF AXIS_NUM is the slave axis number
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
PhaseShift	Description	Amount of phase shift
	Data type	LREAL
	Range	—
	Unit	User unit
	Default	—
Velocity	Description	Velocity setpoint
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	—
Acceleration	Description	Trapezoidal: Acceleration rate S-curve: Maximum acceleration
	Data type	LREAL
	Range	—
	Unit	User unit/sec ²
	Default	—
Deceleration	Description	Trapezoidal: Deceleration rate S-curve: Unused
	Data type	LREAL

	Range	—
	Unit	User unit/sec ²
	Default	—
Jerk	Description	Trapezoidal: 0 S-curve: Constant jerk
	Data type	LREAL
	Range	—
	Unit	User unit/sec ³
	Default	—
BufferMode	Description	0. abort 1. buffer 2. blend to active 3. blend to next 4. blend to low velocity 5. blend to high velocity
	Data type	SINT
	Range	[0,5]
	Unit	n/a
	Default	—

2.2.5.86.4.2 Output

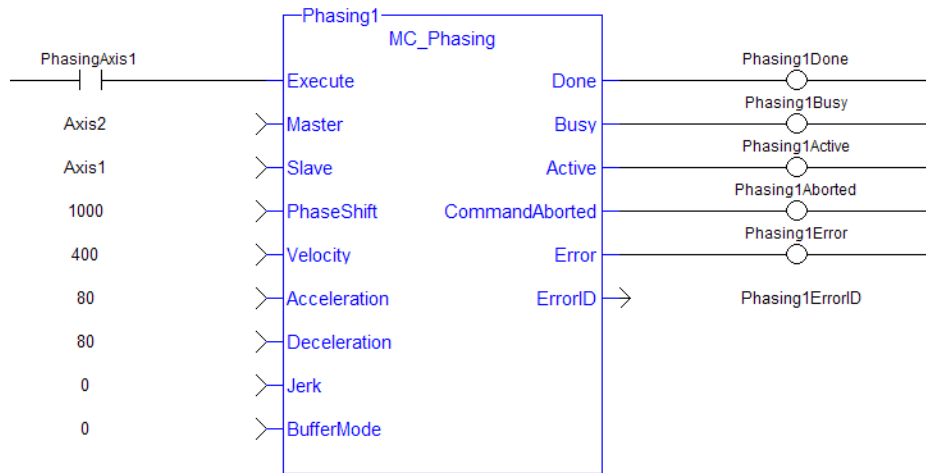

Done	Description	Indicates the phase shift has been completely applied
	Data type	BOOL
Busy	Description	High from the moment the Execute input is one-shot to the time the move is ended
	Data type	BOOL
Active	Description	Indicates this phase shift is the active phase shift
	Data type	BOOL
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
Error	Description	Indicates an invalid input was specified or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

```

2.2.5.89.7.2 Ladder Diagram

2.2.5.90 MC_SyncSlaves

2.2.5.91.1 Description

This function block allows the application to specify what slave axes are to be synchronized and which master they follow. After this function block is executed successfully, all the slave axes specified at the SlaveList input start their slave moves (i.e. MC_GearIn, MC_CamIn, etc.) on the same servo interrupt for a synchronized slave start. When a slave move is commanded for one of the slave axes listed, the slave move is queued but the motion is held off until all of the listed slaves have queued their slave moves.

Figure 1-86: MC_SyncSlaves

2.2.5.92.2 Arguments

2.2.5.93.3.1 Input

Execute	Description	A positive transition of this input causes the function block to execute
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Master	Description	Master axis identifier
	Data type	AXIS_REF
	Range	1 - 256
	Unit	n/a
SlaveCount	Description	The number of slave axes listed in the SlaveList array input that are to be synchronized. This number must not be greater than the declared size of the SlaveList array. If this number is 0, the list of synchronized slaves for the specified Master axis is cleared.
	Data type	AXIS_REF
	Default	—

	Range	1-256 The AXIS_NUM element of the AXIS_REF structure must be in the range [1-256]
	Unit	n/a
	Default	—
SlaveList	Description	The list of slave axes that are to be synchronized. Each element of this array contains a unique axis number. The axis number must not be the same as the Master axis number.
	Data type	UINT
	Range	1-32
	Unit	n/a
	Default	—

2.2.5.94.4.2 Output

Done	Description	Indicates the synchronized slave assignments were completed without error
	Data type	BOOL
Error	Description	Indicates an invalid input was specified
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE
	Data type	INT

2.2.5.95.5 Usage

Call MC_SyncSlaves to specify the slave axes to synchronize.

Call each slave move (e.g. MC_GearIn) for each slave axis. The motion is held off until all the slave moves have been queued.

After all the slave moves have been queued, the interpolation for all the slave axes begin on the same servo interrupt, providing a synchronized start.

The master axis can be in motion prior to this sequence, or the master can be commanded after all the slave moves are queued.

2.2.6 Reference Functions

This set of functions provides commands for reference points.

2.2.6.1 MC_Reference

2.2.6.2.1 Description

This function block is used to execute a fast home to a switch. If the application selects to reference to the index mark of an encoder, or the null of a resolver (which is typical), the new position value is assigned to the position of the index of the encoder (or the null of the resolver) and not the position of the switch. The [ECATWriteSDO](#) function block is used to setup the trigger event and any desired preconditions. **This function block utilizes the Position Capture Mode of the AKD.**

NOTE

At this time, position capture is not available for PLCopen axes assigned to the secondary feedback input (digitizing axes). Therefore, MC_Reference cannot be used to home digitizing axes at this time.

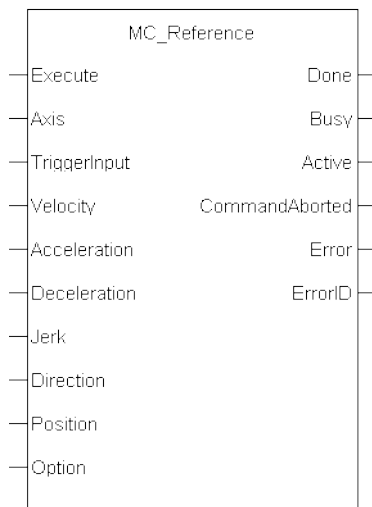

Figure 1-87: MC_Reference

2.2.6.3.2 Arguments

2.2.6.4.3.1 Input

Execute	Description	Requests to queue the MC_Reference move and arms reference trigger events
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

Axis	Description	Name of a declared instance of the AXIS_REF library function.)
	Data type	AXIS_REF
	Range	[1,256]
	Unit	n/a
	Default	—
TriggerInput	Description	TRIGGER_REF structure defines the trigger InputID INT : 0 = Capture Engine 0 1 = Capture Engine 1 Range is [0,1] For information on configuring the capture engines, refer to AKD Capture Engine Configuration. Direction INT; 1 = rising edge of trigger, 2 = falling edge of trigger Trigid INT; must be zero
	NOTE	
	TrigMode INT (TriggerInput.TrigMode) is not presently supported by this function. The TriggerInput.Mode may be supported in a future software version.	
	Data type	TRIGGER_REF
	Range	See Description above
Velocity	Unit	n/a
	Default	—
	Description	Commanded velocity for the reference move
	Data type	LREAL
	Range	—
Acceleration	Unit	User unit/sec
	Default	—
	Description	Commanded acceleration for the reference move
	Data type	LREAL
	Range	—
Deceleration	Unit	User unit/sec ²
	Default	—
	Description	Commanded deceleration for the reference move
	Data type	LREAL
	Range	—
Jerk	Unit	User unit/sec ²
	Default	—
	Description	Commanded jerk for the reference move (if zero, then trapezoidal acc/dec is used)
	Data type	LREAL
	Range	—
Jerk	Unit	User unit/sec ³

Direction	Default	—
	Description	Commanded Direction of the reference
	Data type	SINT
	Range	[0,1]
	Unit	n/a
Position	Default	—
	Description	Position of the axis at the reference location
	Data type	LREAL
	Range	—
	Unit	User unit
Option	Default	—
	Description	Option identifier for Resolvers/Modulo reference. 0 = Use latched position for reference 1 = use resolver position of nearest null for reference 2 pole resolver 2 = use resolver position of nearest null for reference 4 pole resolver 3 = use resolver position of nearest null for reference 6 pole resolver 4 = use resolver position of nearest null for reference 8 pole resolver 5 = use resolver position of nearest null for reference 10 pole resolver ... 15 = use resolver position of nearest null for reference 30 pole resolver
	Data type	SINT
	Range	[0,15]
	Unit	n/a
	Default	—

2.2.6.5.4.2 Output

Done	Description	Indicates the reference move and position adjustment is complete
	Data type	BOOL
Busy	Description	Indicates this function block is executing
	Data type	BOOL
Active	Description	Indicates this move is the Active move
	Data type	BOOL
CommandAborted	Description	Indicates the move was aborted
	Data type	BOOL
Error	Description	Indicates an invalid input, or the move was terminated due to an error
	Data type	BOOL
ErrorID	Description	Indicates the error if the Error output is high
	Data type	INT

2.2.6.6.5 Usage

The following lists the steps for homing a PLCopen axis, using the MC_Reference function block. Not all of the steps are necessary depending on the configuration and the homing cycle design.

The sequence of events of a PLCopen homing cycle consists of the following steps:

- Ensure Axis is not on Reference switch.
If a switch is used in the homing cycle for the event or precondition to the event, check to ensure the axis is not already tripping the switches that trigger the event and precondition. If it is, move the axis off the switches.
- Configure AKD capture engine
Configuration of the AKD capture engine is performed by writing drive CAN objects via SDO. It is accomplished with the [ECATWriteSdo](#) function. **The AKD Capture mode must be set to POSITION CAPTURE.**
The available configurations are discussed in paragraph "**AKD Capture Engine Configuration**". Example AKD capture engine configurations and reference examples are discussed in paragraph "**PLCopen Homing Methods**".
- Call the MC_REFERENCE function to initiate optional homing motion and to arm the AKD capture engine
The MC_Reference function block selects the trigger edge (rising or falling edge) and arm the capture. Then, it optionally moves the axis to the reference location as directed by inputs to this function. When the AKD indicates that the capture event has occurred, the coordinate system is shifted so that the reference position input to this function block is set to the reference location. Then, the reference motion is stopped.
- Wait for the completion of the MC_Reference function block
The application is notified by the completion, abort or error of the homing by the MC_Reference function block.
- Upon completion of the MC_Reference function block, the axis can be moved to the home position with a [MC_MoveAbsolute](#) function block.

TIP

Once the MC_Reference block is queued, but before it is completed, the cycle can be aborted with a [MC_Halt](#) or [MC_Stop](#) function block or by queuing a new motion function block with the Abort selected for buffer mode.

```

2.2.6.10.9.2 Ladder Diagram

2.2.6.11 MC_SetPos

2.2.6.12.1 Description

This function block changes the present actual position of the axis (as reported by "MC_ReadActPos" (→ p. 319)) to the position specified by the **Position** and **Mode** inputs. If a motor is associated with the axis, it will not move when MC_SetPos is executed. MC_SetPos does not cause any motion. It applies an offset to the command and actual positions.

MC_SetPos also sets the accumulated Superimposed distance value for the input axis to 0. See the table in Axis Parameters.

This function block replaces the MC_SetPosition function.

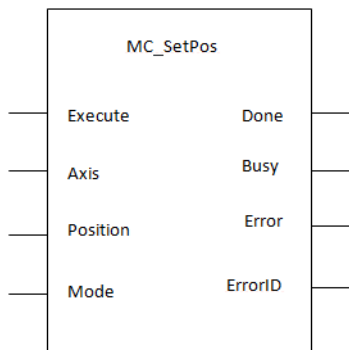

Figure 1-88: MC_SetPos

2.2.6.13.2 Arguments

For more detail on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.2.6.14.3.1 Inputs

Execute	Description	Requests to change the axis position
	Data type	BOOL
	Range	0,1
	Unit	n/a
	Default	—

Axis	Description	Name of a declared instance of the AXIS_REF library function. For more details Modify PLCopen Axis.

2.2.6.19 MC_SetPosition

2.2.6.20.1 Description

This function has been deprecated by the "MC_SetPos" (→ p. 389) function block.

2.2.7 Registration Function Blocks

This set of function blocks allow for Mark-to-Mark or Mark-to-Machine registration. See Registration for techniques on setting up and using the registration function blocks.

2.2.7.1 MC_MachRegist

2.2.7.2 Description

This function block enables Mark-to-Machine registration and can be used on any servo or digitizing axis and with any move type. It is most frequently used in master/slave applications.

Used with ...	Effect
Non-slave moves	Resets the axis position when a good mark is captured by the fast input.
Slave moves	In addition to resetting the axis position, applies a compensation offset to correct for the difference between the target position and the measured position. This provides the ability to compensate for product or process inconsistencies providing a system that remains synchronized with no accumulated error and maintaining repeatable accuracy throughout the process.

- A positive transition of the **En** input will start registration. The application may change the registration parameters while registration is active by changing the input values and causing another positive transition of the En input. The function block will then read and apply the new values.
- The axis number at the **Axis** input indicates the axis whose position, at the fast input, is used to determine if the mark is a good mark.
- The **Distance**, **Tolerance**, and **Ignore** inputs are used to determine whether or not the registration mark is good. For a mark to be recognized as good, it must be outside of the Ignore distance and the correct Distance from the previous mark +/- the Tolerance window. A mark is considered bad if it occurs outside of the “good tolerance band” and is not ignored. Both good marks and bad marks are recognized as marks, ignored marks are not recognized. If all marks are to be recognized as good marks, enter 0 at both **Distance** and **Tolerance**.
- The **Distance** value defines the distance between good marks. In Clear Lane and Product registration the Distance input value typically is the same as the Target input value. However in Print registration the Distance is typically not the same as Target.
- The **Tolerance** value is the distance, plus and minus, about Distance. Marks that are detected within this window are considered good marks and registration will occur. Marks that are detected outside this window and outside the Ignore band, are considered bad marks and registration will not occur. This window should be large enough to allow for the worst case error in the distance between the previous mark and the current mark.
- The **Ignore** value defines the distance from the previous mark where all marks detected by the fast input will be ignored. This is crucial when registering products that do not have Clear Lane registration marks.
- The **Target** input is the expected target position that is used to calculate how much registration compensation is to be applied when a registration mark is considered good. When a good mark is detected, the position of the **PosAxis** is compared to the Target position to calculate a correction. The registration correction will only be applied with master/slave move types.
- The **Position** input is the position value that the registration Axis position will be reset to when a good registration mark is detected.
- When a good mark occurs the position of the **PosAxis** is compared to the Target position and used to calculate the amount of registration compensation to apply to the **CompAxis**.
- Registration compensation is applied to the axis specified at the **CompAxis** input under the following conditions. If **CompAxis** is executing a slave move (i.e. MC_GearIn or MC_CamIn), the compensation is applied directly to the axis. If **CompAxis** is a master axis, the compensation is applied to the master offsets of all its slaves. This shifts the master’s position as seen by its slaves.
- The **PosTolerance** input is the distance, plus and minus, about the Target position used to determine if compensation will be applied. When a good mark occurs, the position of the **PosAxis** axis is checked to see if it lies within the window defined by PosTolerance. If it is in the window, compensation will be applied. If it is outside the window, compensation will not be applied even though a good mark was found.
- If **PosAxis** and **CompAxis** are different axes, the **RatioNumerator** and **RatioDenominator** inputs define the conversion factor for calculating the compensation value. This is needed because the amount of error between actual and target positions is determined by PosAxis’s position and the compensation is applied to the **CompAxis**. The RatioNumerator should typically be the number of User Units of **CompAxis** motion for one registration cycle and the RatioDenominator should typically be the number of User Units of **PosAxis** motion for one registration cycle. If **PosAxis** and **CompAxis** are the same, RatioNumerator and RatioDenominator should be the same value, thus resulting in a 1:1 ratio.
- The **Option** input defines various modes of operation for registration.
 - The first bit, 0001H, selects Absolute or Resetting. This refers to the way in which the second mark and all subsequent marks are determined to be good marks. With both registration schemes, the very first mark detected is the starting point. With Resetting registration, when the next mark is detected, the position of that mark becomes the starting point for the next good mark detection calculation and so on. The starting point is “reset” with each good or bad mark. This feature allows the product to re-synchronize, if necessary, due to process issues like product shift, etc. In contrast, Absolute registration determines all good marks based on the very first mark. The position of the second and each subsequent mark is compared to an integer multiple of Distance from the very first mark. This method insures the product will always

register to a known fixed distance.

- The third bit, 0004H, must always be 0. Mark-to-machine registration requires time-based capture.

2.2.7.3.1 Arguments

2.2.7.4.2.1 Input

En	<p>Description Rising edge of EN enables execution</p> <p>Data type BOOL</p> <p>Range 0, 1</p> <p>Unit n/a</p> <p>Default —</p>

Zero indicates this trigger axis is to be the same as the Axis input. range = [0,256]</p> <div style="background-color: #333; color: white; text-align: center; padding: 2px;">NOTE</div> <div style="background-color: #eee; padding: 5px; margin-top: 5px;"> <p>TrigMode INT (TriggerInput.TrigMode) is not presently supported by this function. The TriggerInput.Mode may be supported in a future software version.</p> </div> <p>Data type TRIGGER_REF</p> <p>Range</p> <p>Unit</p> <p>Default</p>
Distance	<p>Description This is the expected distance between good marks. Along with Tolerance and Ignore, this value is used to determine if the mark detected by the fast input is a good mark.</p> <p>Data type LREAL</p> <p>Range When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$. This value must have the same sign as Ignore.</p> <p>Unit user units</p> <p>Default n/a</p>

Tolerance	Description	This value specifies the distance, plus or minus, about Distance to determine if the mark detected by the fast input is a good mark.
	Data type	LREAL
	Range	When converted to feedback units, the range is $[0, 2^{51}-1]$
	Unit	user units
	Default	n/a
Ignore	Description	This value specifies the distance after the previous good mark in which any detected marks are ignored.
	Data type	LREAL
	Range	When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$. This value must have the same sign as Distance.
	Unit	user units
	Default	n/a
Target	Description	This is the target position. This position is compared to the actual position captured by the fast input to determine the amount of registration compensation to apply.
	Data type	LREAL
	Range	When converted to feedback units, the range is: <ul style="list-style-type: none"> • $[-2^{51}, 2^{51}-1]$ if PosAxis' rollover value is zero • $[0, \text{PosAxis' Rollover Value}]$ if PosAxis' rollover value is non-zero (i.e., $\geq 0 < \text{PosAxis' Rollover Value}$)
	Unit	user units
	Default	n/a
Position	Description	The position the axis is set to when a good registration mark occurs.
	Data type	LREAL
	Range	When converted to feedback units, the range is: <ul style="list-style-type: none"> • $[-2^{51}, 2^{51}-1]$ if PosAxis' rollover value is zero • $[0, \text{PosAxis' Rollover Value}]$ if PosAxis' rollover value is non-zero (i.e., $\geq 0 < \text{PosAxis' Rollover Value}$)
	Unit	user units
	Default	n/a
PosAxis	Description	The position of this axis at the time the fast input occurs is compared to the Target position to determine the amount of registration compensation to apply.
	Data type	AXIS_REF
	Range	The range of .AXIS_NUM is $[1, 256]$
	Unit	n/a
	Default	n/a
CompAxis	Description	The calculated registration compensation is applied to this axis.
	Data type	AXIS_REF
	Range	The range of .AXIS_NUM is $[1, 256]$
	Unit	n/a
	Default	n/a

PosTolerance	Description	This value specifies the distance, plus or minus, about the Target position to determine if the position will be accepted and compensation value is calculated and applied.
	Data type	LREAL
	Range	When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$
	Unit	user units
	Default	n/a
RatioNumerator	Description	This value is typically the number of User Units of CompAxis motion for one product cycle. This value is used with RatioDenominator to create a conversion factor for calculating the compensation value when PosAxis and CompAxis are different axes.
	Data type	DINT
	Range	When converted to feedback units, the range is [1,4294967295]
	Unit	user units
	Default	n/a
RatioDenominator	Description	This value is typically the number of User Units of PosAxis motion for one product cycle. This value is used with RatioNumerator to create a conversion factor for calculating the compensation value when PosAxis and CompAxis are different axes.
	Data type	DINT
	Range	When converted to feedback units, the range is [1,4294967295]
	Unit	user units
	Default	n/a
Options	Description	Each bit enables/disables an option. The following table defines the bits. Any bits not defined are reserved. The third bit, 0004H, must be 0.
	Data type	UINT
	Range	refer to the following options table
	Unit	n/a
	Default	n/a

Hexadecimal	Decimal	Option	Description
0001 H	1	Absolute/Resetting	0 = Resetting, 1 = Absolute
0002 H	2	Reserved	0
0004 H	4	Time/position based capture	0 = time based capture, 1 = position based capture
0008 H	8	Inhibit Reference on Good Mark	0 = Perform reference, 1 = inhibit reference
0010H	16	Inhibit Master Compensation	0 = Perform Master Compensation, 1 = Inhibit Master Compensation
0020H	32	Inhibit Slave Compensation	0 = Perform Slave Compensation, 1 = Inhibit Slave Compensation.

2.2.7.12 MC_MarkRegist

2.2.7.13.1 Description

This function block enables mark-to-mark registration and can be used on any servo or digitizing axis and with any move type. This function block is most frequently used in master/slave applications.

Used with ...	Effect
Non-slave moves	Resets the axis position when a good mark is captured by the fast input.
Slave moves	In addition to resetting the axis position, applies a compensation offset to correct for the difference between the target mark-to-mark distance and the measured mark-to-mark distance. This provides the ability to compensate for product or process inconsistencies providing a system that remains synchronized with no accumulated error and maintaining repeatable accuracy throughout the process.

- A positive transition of the **En** input will start registration. The application may change the registration parameters while registration is active by changing the input values and causing another positive transition of the En input. The function block will then read and apply the new values.
- The axis number at the **Axis** input identifies the axis of registration. If Axis is a master axis for another axis's slave move, Master Registration will be activated. Master Registration calculates a compensation that is added to the master offset of its slaves. This offset shifts the position of the master axis as seen by its slaves. The compensation is not applied to the master axis, but to its slaves. If Axis is a slave axis, Slave Registration will be activated. Slave Registration calculates a

compensation that is added to the slave offset of the axis. This compensation value is applied directly to the slave axis.

- The **Distance**, **Tolerance**, and **Ignore** inputs are used to determine whether or not the registration mark is good. For a mark to be recognized as good, it must be outside of the Ignore distance and the correct Distance from the previous mark +/- the Tolerance window. A mark is considered bad if it occurs outside of the “good tolerance band” and is not ignored. Both good marks and bad marks are recognized as marks, ignored marks are not recognized. If all marks are to be recognized as good marks, enter 0 at both **Distance** and **Tolerance**.
- The **Distance** value defines the distance between good marks. In Clear Lane and Product registration the Distance input value typically is the same as the **Target** input value. However in Print registration the Distance is typically not the same as Target.
- The **Tolerance** value is the distance, plus and minus, about **Distance**. Marks that are detected within this window are considered good marks and registration will occur. Marks that are detected outside this window and outside the Ignore band, are considered bad marks and registration will not occur. This window should be large enough to allow for the worst case error in the distance between the previous mark and the current mark.
- The **Ignore** value defines the distance from the previous mark where all marks detected by the fast input will be ignored. This is crucial when registering products that do not have Clear Lane registration marks.
- The **Target** input is the expected distance between good registration marks and is used to calculate how much registration compensation is to be applied when a registration mark is considered good. In many applications this is often equivalent to the product length or the cycle length. When a good mark is detected, the actual distance between the good mark and the previous mark is determined and compared to the Target distance to calculate a correction. The registration correction will only be applied with master/slave move types and always affects the slave axis.
- The **Position** input is the position value that the registration Axis position will be reset to when a good registration mark is detected.
- The **Option** input defines various modes of operation for registration. The first bit, 0001H, selects Absolute or Resetting. This refers to the way in which the second mark and all subsequent marks are determined to be good marks. With both registration schemes, the very first mark detected is the starting point. With Resetting registration, when the next mark is detected, the position of that mark becomes the starting point for the next good mark detection calculation and so on. The starting point is “reset” with each good or bad mark. This feature allows the product to re-synchronize, if necessary, due to process issues like product shift, etc. In contrast, Absolute registration determines all good marks based on the very first mark. The position of the second and each subsequent mark is compared to an integer multiple of Distance from the very first mark. This method insures the product will always register to a known fixed distance.

2.2.7.14.2 Arguments

2.2.7.15.3.1 Input

En	Description	Rising edge of EN enables execution
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Axis	Description	Axis to apply registration to
	Data type	AXIS_REF
	Range	The range of .AXIS_NUM is [1,256]
	Unit	n/a
	Default	n/a

TriggerInput

Description Structure specifying the fast input.
The structure elements are:

InputID INT
0 = Capture Engine 0
1 = Capture Engine 1
Range is [0, 1]
For information on configuring the capture engines, refer to AKD Capture Engine Configuration.

DirectionINT
1 = rising edge, 2 = falling edge, 3 = NA, 4 = toggle between both, falling edge first, 5 = toggle between both, rising edge first, range = [1, 5]

TrigIDINT
Axis number of the fast input. Zero indicates this trigger axis is to be the same as the Axis input. range = [0, 256]

NOTE

TrigMode INT (TriggerInput.TrigMode) is not presently supported by this function. The TriggerInput.Mode may be supported in a future software version.

Data type TRIGGER_REF

Range

Unit

Default

Distance

Description This is the expected distance between good marks. Along with Tolerance and Ignore, this value is used to determine if the mark detected by the fast input is a good mark.

Data type LREAL

Range When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$. This value must have the same sign as Ignore.

Unit user units

Default n/a

Tolerance

Description This value specifies the distance, plus or minus, about Distance to determine if the mark detected by the fast input is a good mark.

Data type LREAL

Range When converted to feedback units, the range is $[0, 2^{51}-1]$

Unit user units

Default n/a

Ignore

Description This value specifies the distance after the previous good mark in which any detected marks are ignored.

Data type LREAL

Range When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$. This value must have the same sign as Distance.

Unit user units

Default n/a

Target	<p>Description This is the target distance between good marks. This distance is compared to the actual distance measured by the fast input to determine the amount of registration compensation to apply.</p> <p>Data type LREAL</p> <p>Range When converted to feedback units, the range is $[-2^{51}, 2^{51}-1]$. This value must have the same sign as Distance.</p> <p>Unit user units</p> <p>Default n/a</p>
Position	<p>Description The position the axis is set to when a good registration mark occurs</p> <p>Data type LREAL</p> <p>Range When converted to feedback units, the range is:</p> <ul style="list-style-type: none"> • $[-2^{51}, 2^{51}-1]$ if PosAxis' rollover value is zero • $[0, \text{PosAxis' Rollover Value}]$ if PosAxis' rollover value is non-zero (i.e., $\geq 0 < \text{PosAxis' Rollover Value}$) <p>Unit user units</p> <p>Default n/a</p>
Options	<p>Description Each bit enables/disables an option. The following table defines the bits. Any bits not defined are reserved.</p> <p>Data type UINT</p> <p>Range Refer to the following options table.</p> <p>Unit n/a</p> <p>Default n/a</p>

Hexadecimal	Decimal	Option	Description
0001 H	1	Absolute/Resetting	0 = Resetting, 1 = Absolute
0002 H	2	Reserved	0
0004 H	4	Time/position based capture	0 = time based capture, 1 = position based capture
0008 H	8	Inhibit Reference on Good Mark	0 = Perform reference, 1 = inhibit reference
0010H	16	Inhibit Master Compensation	0 = Perform Master Compensation, 1 = Inhibit Master Compensation
0020H	32	Inhibit Slave Compensation	0 = Perform Slave Compensation, 1 = Inhibit Slave Compensation.

Table 1-3: MC_MarkRegist Options Table.

TIP

To use Capture Engine 1 modify the input PDOs that are used and add the Latch Position 1 parameter.

2.2.7.16.4.2 Outputs

RegistOn	<p>Description Indicates that registration is active.</p> <p>Data type BOOL</p>
Aborted	<p>Description Indicates registration has been terminated by MC_StopRegist.</p> <p>Data type BOOL</p>
Error	<p>Description Indicates an invalid input was specified or registration was terminated due to an error</p> <p>Data type BOOL</p>

ErrorID	Description	Indicates the error if Error output is TRUE. See table in PLCopen Function Block ErrorID Output.
	Data type	INT

```

2.2.8 Superimposed Axes

This feature allows the application program to superimpose the moves of multiple axes ("Superimposed Axes") on top of the move of another axis ("Receiving Axis"). This is performed internally by adding the command deltas of the Superimposed Axes to the command delta of the Receiving Axis. Up to four different Superimposed Axes can be superimposed upon a Receiving Axis.

See "MC_AddSuperAxis" (→ p. 403), "MC_RemSuperAxis" (→ p. 405) and PLCopen Function Blocks - Overview for more information.

2.2.8.1 MC_AddSuperAxis

This function will add a Superimposed Axis to the Axis's list of assigned superimposed axes. While the Superimposed Axis is on this list, its command deltas will be added to the Axis's command deltas. Up to four different superimposed axes can be on an axis's list. The *Axis* and the *SuperimposedAxis* must have the same update rate. The *OK* output will go high to indicate that the function executed successfully. If the *OK* output does not go high, one of the following errors was detected:

- Axis and SuperimposedAxis do not have the same update rate
- Four different superimposed axes have already been assigned to Axis
- Axis is not a valid axis - Axis is not a servo or virtual axis

- SuperimposedAxis is not a valid axis number
- SuperimposedAxis is not a servo or virtual axis

2.2.8.2.1 Inputs

En	Description	Enables Execution
	Data Type	BOOL
	Range	n/a
	Unit	n/a
	Default	n/a
Axis	Description	Axis to receive the additional superimposed axis's command delta
	Data Type	AXIS_REF
	Range	.AXIS_NUM [1,256]
	Unit	n/a
	Default	n/a
SuperimposedAxis	Description	Axis number of the superimposed axis whose command delta will be added to delta of <i>Axis</i>
	Data Type	UINT
	Range	[1,256]
	Unit	n/a
	Default	n/a

2.2.8.3.2 Outputs

OK	Description	Execution successful
	Data Type	BOOL

"MC_RemSuperAxis" (→ p. 405)

2.2.8.9 MC_RemSuperAxis

This function removes the Superimposed Axis from the Axis's list of assigned superimposed axes. If the value at `SuperimposedAxis` is 0 all the assigned superimposed axes will be removed from Axis's list. The `OK` output will go high to indicate that the function executed successfully. If the `OK` output does not go high, one of the following errors was detected:

- Axis is not a valid axis
- Axis is not a servo or virtual axis

2.2.8.10.1 Inputs

En	Description	Enables Execution
	Data Type	BOOL
	Range	-
	Unit	n/a
	Default	
Axis	Description	Axis whose list of assigned superimposed axes will be updated.
	Data Type	AXIS_REF
	Range	.AXIS_NUM [1,256]
	Unit	n/a
	Default	n/a
SuperimposedAxis	Description	Axis number of the superimposed axis that will be removed from Axis's list of assigned superimposed axes. A value of 0 will remove all superimposed axes from Axis's list.
	Data Type	UINT
	Range	n/a
	Unit	n/a
	Default	n/a

2.2.8.11.2 Outputs

OK	Description	Execution successful
	Data Type	BOOL

"MLProfileRelease" (→ p. 416)	Removes a Profile so the Profile ID may be used by a different or new Profile.	See "Output" (→ p. 417)

2.3.2.1 MLProfileBuild

2.3.2.2.1 Description

This Function Block allows the application to create a cam profile that may be executed by a cam block in PipeNetwork or PLCopen. This Function Block will take input as cam data (see Cam Profile Editor's Cam Table for information) and profile properties from application data memory and compile the input data to 5th order polynomials. The input cam data and profile properties are similar to the cam data entered in the IDE's Cam Editor and the runtime's Cam Profile Properties dialog. MLProfileBuild internally perform two functions:

1. Compile the cam data (like the cam editor performs in the IDE).
2. Puts the compiled profile into the profile object so it can be used by other Profile Function Blocks (provides similar functionality to "MLProfileInit" (→ p. 414)).

NOTE

Prior to using MLProfileBuild you must call "MLProfileCreate" (→ p. 413) to create the profile object. The ID output of MLProfileCreate is then used as the ProfileID input to MLProfileBuild. MLProfileCreate must be performed in the application *before* the "MLMotionStart" (→ p. 421) command is executed.

MLProfileBuild will compile the cam profile data specified at the CamData input and write the resulting profile to the CAM Profile object specified at input ProfileID. The created profile can then be used as an input to PLCopen Cam Function Blocks ([MC_CamTblSelect](#), [MC_CamIn](#), [MC_CamOut](#)), or any Pipe network Cam Profile Function/Function Blocks. When the operation is complete, the Done output will go high. If an error is encountered, the Error output will go high and the ErrorID output will return a error code. If the Error can be attributed to a specific profile element in the CamData array, ErrorElem will attempt to indicate the element in error.

2.3.2.3.2.1 CamProps_Ref Structure

The cam properties structure (CamProps_Ref) will contain the following data members:

InputScale	LREAL	The input amplitude or x-axis multiplier applied to the CAM profile
OutputScale	LREAL	The output amplitude or y-axis multiplier applied to the CAM profile
InputOffset	LREAL	input offset or x-axis shift applied to the CAM profile
OutputOffset	LREAL	The output offset or y-axis shift applied to the CAM profile

See Master/Input offset for more information about the parameters which transform the cam profile.

2.3.2.4.3.2 CamData_Ref Structure

The cam data structure (CamData_Ref) will be an array of structures. Each element of the structure will contain the following data members:

MasterIn	LREAL	master position of the point (in the unit range [0 - InputScale])
SlaveOut	LREAL	slave position of the point (in the unit range [0 - OutputScale])
Type	UINT	1 = Point, 2 = Line
Vel	LREAL	Cam velocity at the point. Units: (slave position user units) / (master position user units)
Accel	LREAL	Cam acceleration at the point. Units: (slave position user units) / (master position user units)

See Cam Profile Editor's Cam Table for more information.

2.3.2.5.4 Arguments

2.3.2.6.5.1 Input

Enable	Description	Enable execution. Starts on rising edge.
	Data Type	BOOL
	Range	
	Unit	
	Default	
Cam_Props	Description	Structures containing the Cam Profile Properties
	Data Type	CamProps_ref
	Range	
	Unit	
	Default	
Cam_Data	Description	Array of Structures containing the Cam Profile data
	Data Type	CamData_ref
	Range	N=3 to 2000 elements
	Unit	
	Default	3 elements minimum size

NumOfPts	Description	Number of profile points in the array that are to be used.
	Data Type	UINT
	Range	3 - 2000
	Unit	elements
	Default	3
ProfileID	Description	ID number of a created CAM Profile
	Data Type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	--
Cyclic	Description	False: one time through the profile; True: repeating profile
	Data Type	BOOL
	Range	0-1 (FALSE/TRUE)
	Unit	
	Default	
Options	Description	For future expansion. This must be set to Zero for the time being.
	Data Type	UINT
	Range	
	Unit	
	Default	
2.3.2.7.6.2 Output		
Done	Description	Indication of whether or not the profile was successfully compiled and built.
	Data Type	BOOL
	Range	0-1 (FALSE/TRUE)
	Unit	
	Default	
Busy	Description	Indication that the function block is executing. TRUE if executing. False if not executing.
	Data Type	BOOL
	Range	0-1 (FALSE/TRUE)
	Unit	
	Default	
Err	Description	Indication that the function did not execute correctly. ErrorID output will be valid and indicate the reason.
	Data Type	BOOL
	Range	0-1 (FALSE/TRUE)
	Unit	
	Default	
ErrorID	Description	Indication of the reason for the failure to execute properly. See "Error Codes" (→ p. 411) table.
	Data Type	INT
	Range	
	Unit	
	Default	

ErrorElem	Description	The array element number of the cam data where an error is detected
	Data Type	UINT
	Range	
	Unit	

2.3.2.8.7 Error Codes

NOTE

If **Cyclic** is TRUE and the Vel/Accel of the first and last elements do not match, MLProfileBuild will automatically copy the first element's vel/accel to the last element's. A LOG warning message will be posted indicating that this change has occurred.

ErrorID	Description
100	Too many points specified. Cam data array does not contain that many points.
101	Invalid master or slave amplitude. Amplitude is less than zero.
102	Point is outside amplitude range.
103	Segment type is not a point or line. Valid type is a 1 or 2.
104	Point too close to previous point ($0.0005 * \text{master-amplitude}$ is the minimum distance between points).
105	Line too close to previous point ($0.0005 * \text{master-amplitude}$ is the minimum distance between points).
106	Invalid profile ID. Profile ID: <ol style="list-style-type: none"> 1. does not exist 2. has not been created yet 3. profile ID is not a profile
107	Cam data array exceeds maximum array size of 2000 data points.
109	Attempting to build a profile already containing elements. Profile needs to be released first using MLProfileRelease.
200	First point's X value not equal to zero.
201	Last point's X value does not equal value of X-amplitude.
202	Cannot modify the first point in the cam element table. Y value is less than 0 or greater than Y amplitude.
203	Cannot modify the last point in the cam element table. Y value is less than 0 or greater than Y amplitude.

2.3.2.10.9 Example of How to Use MLProfileBuild

Prior to using MLProfileBuild you must first create a profile. This must be done prior to MLMotionStart.

```
// Allocate space for a profile that will be built later
profileID := MLPProfileCreate('ProfileName');
```

Next you need to define your profile data. This is done by creating an array of CamData_Ref structures in the data dictionary and then entering each of your points into that newly created structure. In this example ProfileData is the name of the CamData_Ref structure.

```
// Define the profile data
ProfileData[0].MasterIn := 0.0;
ProfileData[0].SlaveOut := 180.0;
ProfileData[0].SegType := 1;
ProfileData[0].Velocity := 0.0;
ProfileData[0].Acceleration := 0.0;

ProfileData[1].MasterIn := 180.0;
ProfileData[1].SlaveOut := 324.0;
ProfileData[1].SegType := 1;
ProfileData[1].Velocity := 0.5;
ProfileData[1].Acceleration := -0.025;

ProfileData[2].MasterIn := 360.0;
ProfileData[2].SlaveOut := 240.0;
ProfileData[2].SegType := 1;
ProfileData[2].Velocity := 0.0;
ProfileData[2].Acceleration := 0.0;
```

Now you need to define your profile properties. This is done by creating a CamProps_Ref structure in the data dictionary and then entering each of the properties into the newly created structure. In this example ProfileProps is the name of the CamProps_Ref structure.

```
// Define the profile properties
ProfileProps.InputScale := 360.0; // Must be Positive!
ProfileProps.OutputScale := 360.0; // Must be Positive!
ProfileProps.InputOffset := 0.0;
ProfileProps.OutputOffset := 0.0;
```

Next call the MLPProfileBuild Function Block in the IEC language of choice. As part of this call it is recommended that you validate the Done and Error output before proceeding.

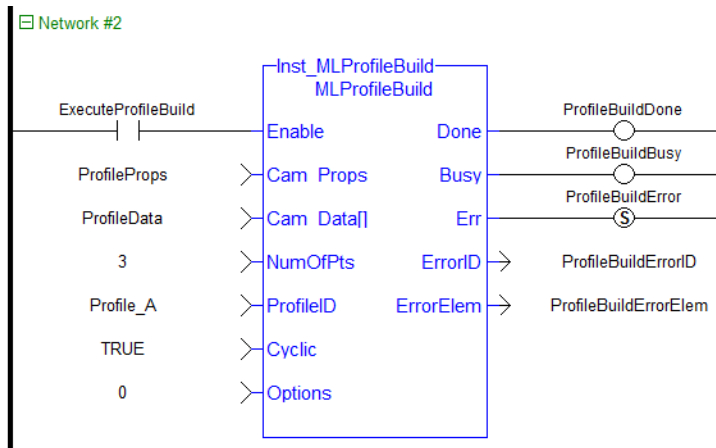

Structured Text:

```
// Build the profile
Inst_MLPProfileBuild( TRUE, ProfileProps, ProfileData, 3, ProfileID, TRUE,
0);
```

Function Block Diagram:

Ladder Diagram:

Finally, after verifying that that MLProfileBuild is Done and there are no errors you can proceed and use the newly generated profile.

- In PLCopen your next step is to call "MC_CamTblSelect" (→ p. 366)
- In PN your next step is to call either "MLCamInit" (→ p. 166) or "MLCamSwitch" (→ p. 168)

2.3.2.11 MLProfileCreate

2.3.2.12.1 Description

Creates a new Profile Object for use in a PLC Program or Pipe Network CAM block. This function block is automatically called if a Profile is created in the Project Explorer, with user-defined settings then entered in the CAM Profile Properties screen.

Profiles are created and initiated separately and the shape is modified with the CAM Editor. With the Editor profiles can be changed graphically or by manually changing values in a numeric table relating input and output values with specific slopes. The Cam Editor software tool provides the capability to visualize, analyze, edit, and smooth profiles.

Profile switching can be done on the fly, without losing synchronization and without dead time. In addition, the offsets and ratios of CAM Profiles can be changed on the fly.

NOTE

Profile objects are normally created in the Project Explorer. Then you do not have to add MLCamInit function blocks to their programs. By right clicking the Profiles folder under the PLC->Motion Tree, you can select Add new profile. Parameters are entered directly in a pop-up window, and the code is then automatically added to the current project.

TIP

This function must be called or executed before "MLMotionStart" (→ p. 421) is called.

2.3.2.13.2 Arguments

2.3.2.14.3.1 Input

Name	Description	Name of initialized CAM Profile
	Data type	STRING
	Range	—
	Unit	n/a
	Default	—

2.3.2.15.4.2 Output

OK	Description	Indicates the profile has been created
	Data type	BOOL
ID	Description	Returns the ID number of the created CAM Profile
	Data type	DINT
	Unit	n/a

2.3.2.16.5 Related Functions

"MLCamInit" (→ p. 166)

2.3.2.17.6 Example

2.3.2.18.7.1 Structured Text

```
//Create a new Profile
Profile_A := MLProfileCreate( 'Profile_A' );
```

2.3.2.19.8.2 Ladder Diagram

2.3.2.20.9.3 Function Block Diagram

2.3.2.21 MLProfileInit

2.3.2.22.1 Description

Initializes a previously created CAM Profile object for use in a PLC Program or Pipe Network CAM block. This function block is automatically called if a Profile is created in the Project Explorer, with user-defined settings then entered in the CAM Profile Properties screen.

Profiles are created and initiated separately and the shape is modified with the CAM Editor. With the Editor profiles can be changed graphically or by manually changing values in a numeric table relating input and output values with specific slopes. The Cam Editor software tool provides the capability to visualize, analyze, edit, and smooth profiles.

Profile switching can be done on the fly, without losing synchronization and without dead time. In addition, the offsets and ratios of CAM Profiles can be changed on the fly.

NOTE

Profile objects are normally initiated in the Project Explorer. Then you do not have to add MLCamInit function blocks to their programs. By right clicking the Profiles folder under the PLC->Motion Tree, you can select Add new profile. Parameters are entered directly in a pop-up window, and the code is then automatically added to the current project.

TIP

Loading a Profile Editor-generated profile into a ProfileID released by MLProfileRelease should be done with

care. The `MLProfileInit ()` function call can take in excess of 4 milliseconds to execute. Application execution is suspended during this time until the function call is completed.

2.3.2.23.2 Arguments

2.3.2.24.3.1 Input

ProfileID	Description	ID number of a created CAM Profile
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—
FileName	Description	Filename used to save Profile on the computer's hard disk
	Data type	STRING
	Range	—
	Unit	n/a
	Default	—
InputScale	Description	The input amplitude or x-axis multiplier applied to the CAM Profile
	Data type	LREAL
	Range	Positive
	Unit	n/a
	Default	—
OutputScale	Description	The output amplitude or y-axis multiplier applied to the CAM Profile
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	—
InputOffset	Description	The input offset or x-axis shift applied to the CAM Profile.
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	—
OutputOffset	Description	The output offset or y-axis shift applied to the CAM Profile
	Data type	LREAL
	Range	—
	Unit	n/a
	Default	—

2.3.2.25.4.2 Output

Default (.Q)	Description	Returns TRUE if a new CAM Profile is initialized
	Data type	BOOL
	Unit	n/a

2.3.2.26.5.3 Return Type

BOOL

MLProfileCreate( Profile_A , 'Profile_A.5op' , 360, 360, 0, 0 );
```

2.3.2.30.9.2 Ladder Diagram

2.3.2.31.10.3 Function Block Diagram

2.3.2.32 MLProfileRelease

An application program is limited to 256 Profile ID's. This FB releases an existing profile ID definition so that the profile ID can be used for a different/new Profile (minimizing the risk of reaching 256 Profile ID's). Once the existing Profile ID definition has been successfully released, the Profile ID can then be used by either "MLProfileInit" (→ p. 414) or "MLProfileBuild" (→ p. 408) to create a new Profile.

The Profile ID selected by the input parameter must not be in-use by a motion engine. In-use is defined as:

- For Pipe Network – it must not be currently selected for use by an active CAM block in an active pipe. Pipe has been activated by "MLCamSwitch" (→ p. 168).
- For PLCOpen – selected for use by "MC_CamIn" (→ p. 352) and has an active move.

There are a number of ways to change an in-use profile to one that is not in-use (deactivated):

- For Pipe Network – Perform a "MLCamSwitch" (→ p. 168) on an active Pipe to a different Profile or deactivate the pipe.

- For PLCOpen – whenever the active profile move is halted or aborted, the profile is no longer in use. "MC_CamOut" (→ p. 359) is one way of aborting the profile move. Actually, any PLCOpen motion command that aborts a profile move will also deactivate a profile.

NOTE

Any profile ID created by [MC_CamTblSelect](#) from the specified ProfileID will be destroyed and need to be recreated upon completion of this FB. This means that all derived profile ID's created by MC_CamTblSelect FB must also not be in use by the PLCOpen motion engine in order for this function to succeed.

TIP

Loading a Profile Editor-generated profile into a ProfileID released by MLProfileRelease should be done with care. The MLProfileInit () function call can take in excess of 4 milliseconds to execute. Application execution is suspended during this time until the function call is completed.

2.3.2.33.1 Arguments

For more information on how Arguments work, refer to PLCOpen function blocks - General rules .

2.3.2.34.2.1 Input

Enable	Description	Enable execution of the function block. Successful completion will result in a profile ID that is no longer assigned to a specific profile and can be reused for a different/new Profile. Prior to reusing this Profile ID it will need to be re-initialized by either an MLProfileInit Function call or by calling MLProfileBuild.
	Data Type	BOOL
	Range	0, 1
	Unit	
	Default	0
ProfileID	Description	Specify a Profile ID that has been created by MLProfileCreate. This is the profile ID that will be released so it can be reused for different/new Profiles. This Profile ID must not be in use by a motion engine.
	Data Type	DINT
	Range	1 to 256
	Unit	
	Default	0

2.3.2.35.3.2 Output

Done	Description	If high, Successful completion. The Profile can now be reused.
	Data Type	BOOL
	Range	0, 1
Err	Description	If high, the Function Block did not complete successfully. Reason is given in Error ID.
	Data Type	BOOL
	Range	0, 1
ErrorID	Description	Indicates the reason for the failure. See "Error Codes" (→ p. 418) table for possible reasons.
	Data Type	INT
	Range	

2.3.2.36.4 Error Codes

ErrorID	Description
106	Invalid profile ID. Profile ID: <ol style="list-style-type: none"> 1. does not exist 2. has not been created yet 3. profile ID is not a profile
108	Profile cannot be released because it is in use by the motion engine or currently selected by an active CAM block.

2.3.3 Motion Library

Name	Description	Return type
"MLMotionInit" (→ p. 420)	Initializes the motion library. Must be called before any other Motion Library function. Returns TRUE if the function succeeded. BasePeriod is the duration of one motion cycle in microseconds.	BOOL
"MLMotionStart" (→ p. 421)	Starts the motion engine, motion bus driver, and initializes EtherCAT network to operational mode. Applicable to PLCopen and PipesNetwork motion engines. Returns TRUE if the function succeeded.	BOOL
"MLMotionStatus" (→ p. 421)	Returns the status of the motion engine 0: Not initialized 1: Running 2: Stopped 3: Error	None
"MLMotionStop" (→ p. 421)	Stops the motion bus driver, motion engine, and EtherCAT network operation, resulting in the EtherCAT network transitioning to the Init state. Returns TRUE if the function succeeded.	BOOL
"MLMotionSysTime" (→ p. 421)	Prints the system time to the log	BOOL
"MLMotionCycleTime" (→ p. 419)	Returns the Motion Base Cycle time in seconds.	

2.3.3.1 State Machine

Figure 1-90: Motion State Machine

The Motion State Machine is driven by the IEC 61131-3 application with the help of the "Motion Library" (→ p. 418) function blocks.

Each arrow represents a transition from one State to another one.

2.3.3.2 MLMotionCycleTime

Returns the Motion Base Cycle time in seconds.

2.3.3.9.7.2 Ladder Diagram

2.3.3.10.8.3 Function Block Diagram

2.3.3.11 MLMotionInit

2.3.3.12.1 Description

Initializes the motion library. Must be called before any other Motion Library function. Returns TRUE if the function succeeded.

NOTE

The BasePeriod argument establishes the base cycle time (in microseconds) for the Motion Engine when running simulations without the EtherCAT Motion Bus. When the EtherCAT Motion Bus is present, the EtherCAT cycle time overrides the BasePeriod argument (the cycle time is defined in the Master tab). The EtherCAT cycle time then becomes the base cycle time for the Motion Engine.

2.3.3.13.2 Parameter

BasePeriod : LREAL (input)

2.3.3.14.3 Return Type

BOOL

2.3.3.15 MLMotionRstErr

2.3.3.16.1 Description

Clears motion engine errors, motion bus driver errors, and EtherCAT network errors. MLMotionRstErr will return the motion engine status to the Stopped state. Returns TRUE if the function succeeded.

See also: "MLMotionStatus" (→ p. 421), "MLMotionStop" (→ p. 421), "MLMotionStart" (→ p. 421)

2.3.3.17.2 Return Type

BOOL

2.3.3.18 MLMotionStart

2.3.3.19.1 Description

Starts the motion engine, motion bus driver, and initializes EtherCAT network to operational mode. Applicable to PLCopen and PipesNetwork motion engines. MLMotionStart does not clear any pre-existing error conditions. Returns TRUE if the function succeeded. If motion engine is in the Error state, MLMotionStart will return FALSE.

See also: "MLMotionStop" (→ p. 421), "MLMotionRstErr" (→ p. 420), "MLMotionStatus" (→ p. 421)

2.3.3.20.2 Return Type

BOOL

2.3.3.21 MLMotionStatus

2.3.3.22.1 Description

Returns the status of the motion engine. Based on the Internal Defines, the status will be one of the following.

```
#define MLSTATUS_NOT_INITIALISED 0 (*Motion not initialised*)
#define MLSTATUS_RUNNING 1 (*Motion is running*)
#define MLSTATUS_STOPPED 2 (*Motion is stopped*)
#define MLSTATUS_ERROR 3 (*Motion is in error*)
```

2.3.3.23.2 Parameter

Status : DINT (output)

2.3.3.24.3 Return Type

None

2.3.3.25 MLMotionStop

2.3.3.26.1 Description

Stops the motion bus driver, motion engine, and EtherCAT network operation, resulting in the EtherCAT network transitioning to the Init state. Returns TRUE if the function succeeded.

See also: "MLMotionStart" (→ p. 421), "MLMotionRstErr" (→ p. 420), "MLMotionStatus" (→ p. 421)

2.3.3.27.2 Return Type

BOOL

2.3.3.28 MLMotionSysTime

2.3.3.29.1 Description

Prints the system time to the log. Returns always TRUE.

2.3.3.30.2 Return Type

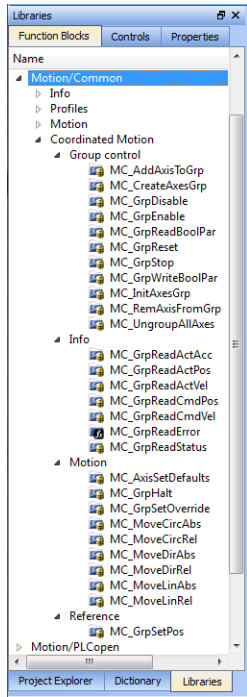

BOOL

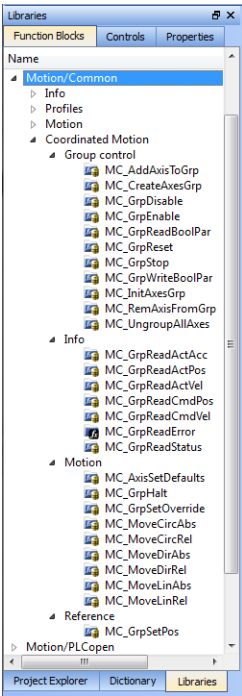

2.3.3.31.3 Units

milliseconds

2.3.4 Coordinated Motion Function Blocks

This section contains a table with an alphabetical list of the Coordinated Motion function blocks. The table includes where the function block can be found in the KAS IDE library, starting from *Motion/Common* > *Coordinated Motion* > (*Grouping*).

Name	Grouping	Description	Location in the Dictionary
MC_AddAxisToGrp	Group Control	Adds an axis to an axes group.	
MC_AxisSetDefaults	Motion	Sets the default kinematic parameters for an axis.	
MC_CreateAxesGrp	Group Control	Create an axis group for coordinated motion.	
MC_ErrorDescription	Motion/Common > Info	Converts the PLCOpen error IDs into message strings	
MC_GrpReset	Group Control	Resets all the axes in an axes group.	
MC_GrpDisable	Group Control	Changes the state of a group to GroupDisabled.	
MC_GrpEnable	Group Control	Changes the state of a group from GroupDisabled to GroupStandby.	
MC_GrpHalt	Motion	Performs a controlled motion stop of all the axes in the group	
MC_GrpReadActAcc	Info	Reads the actual acceleration of the group and the axes in the group.	
MC_GrpReadActPos	Info	Reads the actual position of the axes in the group.	
MC_GrpReadActVel	Info	Reads the actual velocity of the group and the axes in the group.	
MC_GrpReadBoolPar	Group Control	Reads a value from the specified boolean group parameter	
MC_GrpReadCmdPos	Info	Reads the command position of the axes in the group.	
MC_GrpReadCmdVel	Info	Reads the command velocity of the axes in the group and the path velocity.	
MC_GrpReadError	Info	Reads the Group ErrorID in State ERRORSTOP.	
MC_GrpReadStatus	Info	Returns the status of an axes group.	

Name	Grouping	Description	Location in the Dictionary
MC_GrpReset	Group Control	Makes the transition from the state GroupErrorStop to GroupStandby by resetting all internal group-related errors. Also resets axis errors and drive faults for each axis in the group.	
MC_GrpSetOverride	Motion	Sets the velocity factor that is multiplied to the commanded velocity of all axes in the group.	
MC_GrpSetPos	Reference	Sets the axis position for all of the axes in an axes group to the positions specified in the Position input.	
MC_GrpStop	Group Control	Performs a non-aborted, controlled motion stop on all axes in an AxesGroup.	
MC_GrpWriteBoolPar	Group Control	Writes a value to the specified boolean group parameter.	
MC_InitAxesGrp	Group Control	Initializes the kinematic limits for the axis group.	
MC_MoveCircAbs	Motion	Commands interpolated circular movement on an axes group to the specified absolute positions.	
MC_MoveCircRel	Motion	Commands interpolated circular movement on an axes group to the specified relative positions.	
MC_MoveDirAbs	Motion	Commands movement of an axes group to an absolute position regardless of path.	
MC_MoveDirRel	Motion	Commands movement of an axes group to a relative position regardless of path.	
MC_MoveLinAbs	Motion	Commands interpolated linear movement on an axes group to the specified absolute positions.	
MC_MoveLinRel	Motion	Commands interpolated linear movement on an axes group to the specified relative positions.	
MC_RemAxisFromGrp	Group Control	Removes an individual axis from an axis group.	
MC_UngroupAllAxes	Group Control	Removes all axes from an axes group.	

2.3.4.1 Coordinated Motion Group Control Library

Function	Description
"MC_AddAxisToGrp" (→ p. 424)	Adds an axis to an axes group.
"MC_CreateAxesGrp" (→ p. 426)	Create an axis group for coordinated motion.
"MC_GrpDisable" (→ p. 428)	Changes the state of a group to GroupDisabled.

Function	Description
"MC_GrpEnable" (→ p. 430)	Changes the state of a group from GroupDisabled to GroupStandby.
"MC_GrpReadBoolPar" (→ p. 432)	Reads a value from the specified boolean group parameter
"MC_GrpReset" (→ p. 434)	Makes the transition from the state GroupErrorStop to GroupStandby by resetting all internal group-related errors. Also resets axis errors and drive faults for each axis in the group.
"MC_GrpStop" (→ p. 435)	Performs a non-aborted, controlled motion stop on all axes in an AxesGroup.
"MC_GrpWriteBoolPar" (→ p. 438)	Writes a value to the specified boolean group parameter.
"MC_InitAxesGrp" (→ p. 440)	Initializes the kinematic limits for the axis group.
"MC_RemAxisFromGrp" (→ p. 442)	Removes an individual axis from an axis group.
"MC_UngroupAllAxes" (→ p. 444)	Removes all axes from an axes group.

2.3.4.2.1 MC_AddAxisToGrp

2.3.4.3.2.1 Description

This function block adds an axis to an axes group. Both the axis and the axes group must be created prior to calling this function block. See "MC_CreateAxesGrp" (→ p. 426) and Create PLCopen Axis.

The IdentInGroup input specifies the index of the axis in the group. Axes do not need to be added in sequential order and gaps are acceptable. Gaps are ignored when the group is used.

The group must be in either the "GroupStandby" or "GroupDisabled" state when the axis is added. The state of the group can be read with "MC_GrpReadStatus" (→ p. 459). This implies that the group cannot be moving when the axis is added.

This function block does not cause motion.

TIP

- An axes group cannot contain more than one instance of an axis.
- Two active groups cannot contain the same axis. An "active" group is one in any state other than GroupDisabled.

Figure 1-91: MC_AddAxisToGrp

2.3.5.1.1.1 Arguments

2.3.6 Input

Execute	Description	On the rising edge the axis is added to the group.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	Reference to an axes group
	Data type	AXES_GROUP_REF
	Range	—
	Unit	n/a
	Default	—
Axis	Description	Reference to the axis to be added. An axes group cannot contain more than one instance of an axis.
	Data type	AXIS_REF
	Range	—
	Unit	n/a
	Default	—
IdentInGroup	Description	<p>The zero-based index of the axis in the group.</p> <ul style="list-style-type: none"> • The axis slot in the group cannot be occupied by another axis. • The index must be less than the maximum number of axes the group can contain. <code>MaxNumberOfAxes</code> is a property of the axes group and is set when the group is created. <p>To remove an axis from a group see "MC_RemAxisFromGrp" (→ p. 442).</p>
	Data type	UINT
	Range	[0, MaxNumberOfAxes - 1]
	Unit	n/a
	Default	—

2.3.7 Output

Done	Description	If True, then the command completed successfully.
	Data type	BOOL
Error	Description	If True, an error has occurred.
	Data type	BOOL
ErrorID	Description	Indicates the error identifier if Error output is set to True. See the table in PLCopen Function Block ErrorID Output.
	Data type	INT

2.3.11 Ladder Diagram

2.3.11.1.1 MC_CreateAxesGrp

2.3.11.2.2.1 Description

MC_CreateAxesGrp creates an axes group for coordinated motion.

⚠ IMPORTANT

MC_CreateAxesGrp must be called between "MLMotionInit" (→ p. 420) and "MLMotionStart" (→ p. 421).

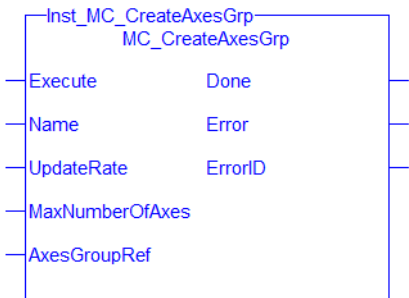

Figure 1-92: MC_CreateAxesGrp

2.3.12 Related Function Blocks

"MC_InitAxesGrp" (→ p. 440), "MC_ErrorDescription" (→ p. 407)

See also "Coordinated Motion", the top-level topic for Coordinated Motion.

2.3.12.1.1.1 Arguments

For more detail on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.3.12.2.2.2 Input

Execute	Description	On the rising edge, this function block will create a coordinated motion axes group	
	Data Type	BOOL	
	Range	0, 1	
	Unit	n/a	
	Default	—	
Name	Description	Axes Group Name	
	Data Type	STRING	
	Range	—	
	Unit	n/a	
	Default	—	
UpdateRate	Description	Update rate of the axes group. The group update rate will be the same as the Base Period specified in "MLMotionInit" (→ p. 420). The update rate will run at the Base Period if it is a smaller time than the Base Period. (0, 1, and 2 are reserved for future enhancements) 3 = 125 µsec 4 = 250 µsec 5 = 500 µsec 6 = 1 msec 7 = 2 msec 8 = 4 msec 9 = 8 msec	
	Data Type	UINT	
	Range	[3,9]	
	Unit	n/a	
	Default	—	
	MaxNumberOfAxes	Description	The maximum number of axes that can be controlled by the group.
		Data Type	UINT
		Range	[0,6]
		Unit	n/a
		Default	—
AxesGroupRef	Description	The axes group reference variable to be initialized with a reference to the new axes group.	
	Data Type	AXES_GROUP_REF	
	Range	n/a	
	Unit	n/a	
	Default	—	

2.3.12.3.3.3 Output

Done	Description	If True, then the command completed successfully.
-------------	--------------------	---

Error	Date Type	BOOL
	Description	If True, then an error has occurred.
ErrorID	Date Type	BOOL
	Description	Indicates the error if Error output is set to TRUE. See the table in PLCopen Function Block ErrorID Output.
	Date Type	INT

2.3.12.4.4 Example

Calls to this function block are automatically generated when the application is compiled. Users should not manually call this function block.

2.3.16.1.1 MC_GrpDisable

2.3.16.2.2.1 Description

MC_GrpDisable changes the state for a group to GroupDisabled. If the group is already in GroupDisabled, then MC_GrpDisable will do nothing. This function block can be issued in the group states: (GroupDisabled, GroupStandby, or GroupErrorStop).

NOTE

MC_GrpDisable will fail if the group is in any state other than GroupStandby or GroupDisabled.

Refer to Group State Diagrams for details.

Figure 1-93: MC_GrpDisable

2.3.17 Related Functions

"MC_GrpEnable" (→ p. 430), "MC_ErrorDescription" (→ p. 407)

See also "Coordinated Motion", the top-level topic for Coordinated Motion.

2.3.17.1.1.1 Arguments

2.3.18 Input

Execute	Description	On the rising edge, request to disable the axis group.
	Data Type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axis group to be disabled
	Data Type	AXIS_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—

2.3.19 Output

Done	Description	If True, then the command completed successfully.
	Data Type	BOOL
Error	Description	If True, then an error has occurred.
	Data Type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE. See the table in PLCopen Function Block ErrorID Output
	Data Type	INT

2.3.22 FBD

2.3.23 FFLD

2.3.23.1.1 MC_GrpEnable

2.3.23.2.2.1 Description

MC_GrpEnable changes the state of a group from GroupDisabled to GroupStandby. If the group is already in GroupStandby, then MC_GrpEnable will do nothing.

NOTE
The group must be in GroupStandby in order to perform motion.

MC_GrpEnable will fail under the following conditions.

- It contains no axes
- The group is not in GroupDisabled or GroupStandby
- One or more axes in the group are in another group that is not in GroupDisabled.

Refer to Group State Diagrams for more details.

2.3.30.1.1 MC_GrpReadBoolPar

2.3.30.2.2.1 Description

This function block reads a value from the specified boolean group parameter. See Recovery of the System State After an Axis Error for more information.

MC_GrpReadBoolPar(Axesgroup_Ref GroupID, Uint BoolID) where BoolID can be one of the following 2 currently defined Booleans:

IGNORE_AXIS_ESTOP: ID = 1000 : The value read will be either TRUE or False as set by the MC_GrpWriteBoolPar function block.

AXIS_ESTOP_ACTIVE: ID = 1001 : This Read-only parameter will be asserted TRUE whenever an axis in the group is experiencing an Axis Estop Error. When there are no Axis Estop Errors present on the axes in a group, this parameter will be set to FALSE.

Figure 1-95: MC_GrpReadBoolPar

2.3.31 Related Function Blocks

"MC_GrpWriteBoolPar" (→ p. 438), "MC_ErrorDescription" (→ p. 407)

See also "Coordinated Motion", the top-level topic for Coordinated Motion.

2.3.31.1.1.1 Arguments

For more details on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.3.32 Input

Enable	Description	If True, then request to read a value from the specified boolean group parameter.
	Data Type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroupRef	Description	The axis group that the boolean parameter value will be read from.
	Data Type	AXES_GROUP_REF
	Range	n/a

ParamNum	Unit	n/a
	Default	—
	Description	ParamNum can be one of the following two currently defined Booleans: <ul style="list-style-type: none"> • IGNORE_AXIS_ESTOP: ID = 1000 : The value read will be either TRUE or False as set by the MC_GrpWriteBoolPar function block. • AXIS_ESTOP_ACTIVE: ID = 1001 : This Read-only parameter will be asserted TRUE whenever an axis in the group is experiencing an Axis Estop Error. When there are no Axis Estop Errors present on the axes in a group, this parameter will be set to FALSE.
	Data Type	UINT
	Range	1000, 1001
	Unit	UINT
	Default	—

2.3.33 Output

Done	Description	If True, then the command completed successfully.
	Data Type	BOOL
Error	Description	If True, an error has occurred.
	Data Type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE. See the table in PLCopen Function Block ErrorID Output.
	Data Type	INT
ParamValue	Description	True or False
	Data Type	BOOL

END_IL
```

2.3.36 FBD

2.3.37 FFLD

2.3.37.1.1 MC_GrpReset

2.3.37.2.2.1 Description

This function block makes the transition from the state GroupErrorStop to GroupStandby by resetting all internal group-related errors – it does not affect the output of the FB instances. This function block also resets axis errors and drive faults for each axis in the group. This function block does not cause any motion.

Figure 1-96: MC_GrpReset

2.3.38 Related Functions

"MC_GrpReadError" (→ p. 457), "MC_GrpReadStatus" (→ p. 459), "MC_ErrorDescription" (→ p. 407)
See also "Coordinated Motion", the top-level topic for Coordinated Motion.

2.3.38.1.1.1 Arguments

For more details on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.3.39 Input

Execute	Description	On the rising edge, this FB resets group-related errors and all of the axes in the group.
	Data Type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axes group in which the axes will be reset.
	Data Type	AXES_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—

2.3.40 Output

Done	Description	If True, then the reset completed successfully.
	Data Type	BOOL
Busy	Description	If True, then the FB is executing.
	Data Type	BOOL
Error	Description	If True, an error has occurred.
	Data Type	BOOL
ErrorID	Description	Indicates the error identifier if Error output is set to TRUE. See table in PLCopen Function Block ErrorID Output.
	Data Type	INT

2.3.40.1.1.1 Example

2.3.41 ST

```
Inst_MC_GrpReset ( EnableReset, Group1_Ref );
```

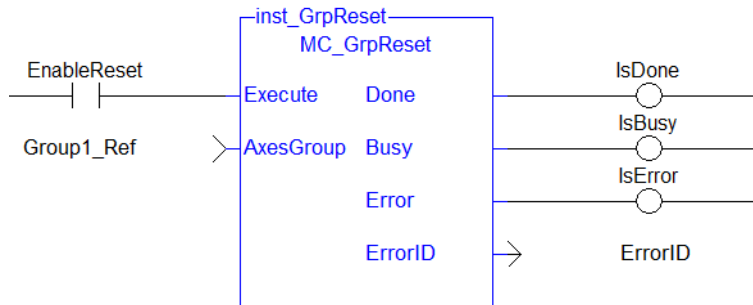

2.3.42 FBD

2.3.43 IL

```
BEGIN_IL
    CAL Inst_MC_GrpReset ( EnableReset, Group1_Ref )
END_IL
```

2.3.44 FFLD

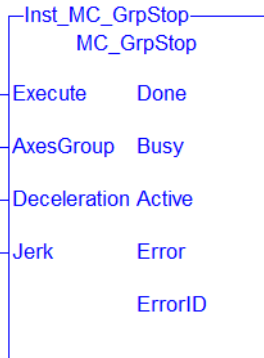

2.3.44.1.1 MC_GrpStop

2.3.44.2.2.1 Description

MC_GrpStop performs a controlled motion stop of all axes in the group. When the path velocity reaches zero any queued moves are flushed from the buffer and the Done output is set. When both the Done output is true and the application has cleared the Execute input the state transitions to GroupStandby. MC_GrpStop *can not be aborted*.

NOTE

MC_GrpStop does NOT prevent a single axis from executing nor does it prevent other Coordinated Motion moves from executing once MC_GrpStop has completed.

2.3.45 Related Functions

"MC_GrpHalt" (→ p. 465), "MC_ErrorDescription" (→ p. 407)

See also "Coordinated Motion", the top-level topic for Coordinated Motion.

2.3.45.1.1.1 Arguments

For more details on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.3.46 Input

Execute	Description	On the rising edge the command to stop all of the axes in the group is initiated.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axes group in which the axes will be stopped.
	Data type	AXES_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—
Deceleration	Description	The path deceleration rate for all of the axes in the group
	Data type	LREAL
	Range	0 < Deceleration
		See Limitations on Acceleration and Jerk for more information.
	Unit	n/a
	Default	—
Jerk	Description	Not supported
	Data type	LREAL

Range	0 ≤ Jerk
	See Limitations on Acceleration and Jerk for more information.
Unit	n/a
Default	—

2.3.47 Output

Done	Description	If True, then the command completed successfully.
	Data type	BOOL
Busy	Description	TRUE from the moment the EXECUTE input is TRUE until the stop is complete.
	Data type	BOOL
Active	Description	If True, then the stop is still executing.
	Data type	BOOL
Error	Description	If True, an error has occurred.
	Data type	BOOL
ErrorID	Description	Indicates the error identifier if Error output is set to TRUE. See table in PLCopen Function Block ErrorID Output.
	Data type	INT

END_IL
```

2.3.50 FBD

2.3.51 FFLD

2.3.51.1.1 MC_GrpWriteBoolPar

2.3.51.2.2.1 Description

This function block writes a value to the specified boolean group parameter. See Recovery of the System State After an Axis Error for more information.

IGNORE_AXIS_ESTOP (BoolID = 1000), and the Value can be either TRUE or FALSE.

- Setting this boolean Parameter to TRUE will result in the Coordinated Motion Engine NOT stopping all axes in a group when one of them is stopped due to an Axis Estop Error. Only the axis experiencing the error will stop when this Parameter is set to TRUE.
- When this parameter is FALSE (Default), all axes in a group will be stopped and the power off request is asserted for each axis.

Figure 1-97: MC_GrpWriteBoolPar

2.3.52 Related Function Blocks

"MC_GrpReadBoolPar" (→ p. 432), "MC_ErrorDescription" (→ p. 407)

2.3.79.1 Coordinated Motion Info Library

Function	Description
"MC_GrpReadActAcc" (→ p. 446)	Reads the actual acceleration of the group and the axes in the group.
"MC_GrpReadActPos" (→ p. 448)	Reads the actual position of the axes in the group.

Function	Description
"MC_GrpReadActVel" (→ p. 450)	Reads the actual velocity of the group and the axes in the group.
"MC_GrpReadCmdPos" (→ p. 453)	Reads the command position of the axes in the group.
"MC_GrpReadCmdVel" (→ p. 455)	Reads the command velocity of the axes in the group and the path velocity.
"MC_GrpReadError" (→ p. 457)	Reads the Group ErrorID in State ERRORSTOP.
"MC_GrpReadStatus" (→ p. 459)	Returns the status of an axes group.

2.3.79.2.1 MC_GrpReadActAcc

2.3.79.3.2.1 Description

The MC_GrpReadActAcc function block fills the array specified by the 'Acceleration' argument with the actual acceleration of the system in the coordinate system specified by the CoordSystem argument. The measured path acceleration is also calculated and reported via the 'PathAcceleration' output. This function block does not cause any motion.

NOTE

- The actual acceleration is smoothed over the last 10 samples. This reduces the error in acceleration estimation, but introduces a small amount of phase delay in the reported accelerations.
- Currently, only the ACS coordinate system is supported. See Coordinate Systems to learn more.

Figure 1-101: MC_GrpReadActAcc

There is a one-to-one correspondence between the axes in the Axes Group array and the acceleration values in the Acceleration array. Each element in the Acceleration array corresponds to the axis element in the Axes Group array. If an index in the Axes Group is unassigned then the acceleration value for that array element in the Acceleration array will be 0. If the element does contain an axis then the acceleration value will be filled with the current actual acceleration for that axis. Here is an example to illustrate how this works:

2.3.80 Related Functions

"MC_GrpReadActPos" (→ p. 448), "MC_GrpReadActVel" (→ p. 450), "MC_GrpReadCmdPos" (→ p. 453), "MC_GrpReadCmdVel" (→ p. 455)

2.3.80.1.1.1 Arguments

For more detail on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.3.81 Input

Enable	Description	If True, then this function block will read the current actual acceleration of the group and the axes in the group
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axes group from which the actual acceleration will be read.
	Data type	AXES_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—
CoordSystem	Description	The coordinate system used when reading the actual acceleration
	Data type	SINT
	Range	One of the following enumeration values: <ul style="list-style-type: none"> • MC_COORDINATE_SYSTEM_ACS = 0 • MC_COORDINATE_SYSTEM_MCS = 1 • MC_COORDINATE_SYSTEM_PCS = 2
	Unit	n/a
	Default	—
Acceleration[]	Description	An array where the acceleration data will be written. The length of the array must equal the maximum number of axes allowed in the group. The maximum number of axes is an argument to "MC_CreateAxesGrp" (→ p. 426) that is used to create axes groups.
	Data type	LREAL
	Range	n/a
	Unit	User units per second ²
	Default	—

2.3.82 Output

Valid	Description	If true, the accelerations have been read without error.
	Data type	BOOL
Error	Description	If true, an error has occurred.
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output was set to TRUE. See the table PLCopen Function Block ErrorID Output
	Data type	INT
PathAcceleration	Description	The current measured path acceleration of the group, measured by taking the square root of the sum of the squared accelerations of each axis.
	Data type	LREAL

Unit User units per second²

END_IL
```

2.3.92 FBD

2.3.93 Ladder Diagram

2.3.93.1.1 MC_GrpReadActVel

2.3.93.2.2.1 Description

MC_GrpReadActVel fills the array specified by the 'Velocity' argument with the actual velocity of the system in the coordinate system specified by the CoordSystem argument. The measured path velocity is also calculated and reported via the 'PathVelocity' output. This function block does not cause any motion.

NOTE

- The actual velocity is smoothed over the last 10 samples. This reduces the error in velocity estimation, but introduces a small amount of phase delay in the reported velocities.
- Currently, only the ACS coordinate system is supported. See Coordinate Systems to learn more.

**Figure 1-103:** MC_GrpReadActVel

There is a one to one correspondence between the axes in the Axes Group and the velocity values in the Velocity Array. Each element in the Velocity array corresponds to the axis element in the Axes Group array. If an index in the Axes Group is unassigned then the velocity value for that array element in the Velocity array will be 0. If the element does contain an axis then the velocity value will be filled with the current actual velocity for that axis. Here is an example to illustrate how this works:

2.3.120.1.1 MC_GrpReadStatus

2.3.120.2.2.1 Description

MC_GrpReadStatus returns the status of an axes group. This function block does not cause any motion. Refer to Group State Diagrams for details.

NOTE

The following output is not currently supported. It will be supported in a future release.

- GroupHoming

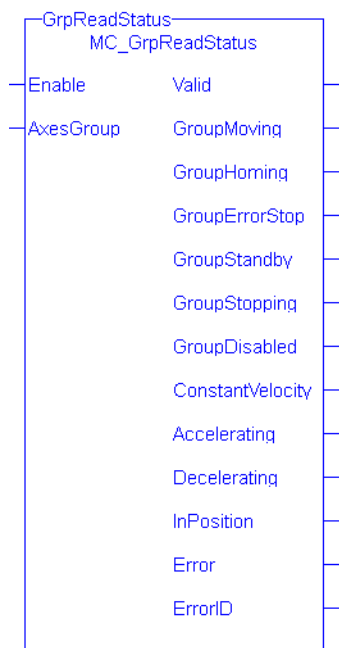

Figure 1-107: MC_GrpReadStatus

2.3.121 Related Functions

"MC_ErrorDescription" (→ p. 407)

See also "Coordinated Motion", the top-level topic for Coordinated Motion.

2.3.121.1.1.1 Arguments

2.3.121.2.2.2 Input

Enable	Description	If True, then the axes group status will be read.
	Data type	BOOL
	Range	0. 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axis group from which the status will be read

Data type	AXIS_GROUP_REF
Range	n/a
Unit	n/a
Default	—

2.3.121.3.3.3 Output

Valid	Description	True if valid outputs are available
	Data type	BOOL
GroupMoving ¹	Description	The axes group is in the Moving state, indicating that the group is enabled and currently executing a coordinated motion command.
	Data type	BOOL
GroupHoming ¹	Description	Not supported
	Data type	BOOL
GroupErrorStop ¹	Description	The axes group is in the ErrorStop state due to an axis error or group error. The group cannot accept coordinated motion commands. The execution of MC_GrpReset is required to change the group's state from ErrorStop to Standby.
	Data type	BOOL
GroupStandby ¹	Description	The axes group is in the Standby state, meaning that the group is enabled and all its axes are enabled and the group is not currently executing a coordinated motion command. The axes group is ready to accept coordinated motion commands.
	Data type	BOOL
GroupStopping ¹	Description	The axes group is in the Stopping state due the execution of MC_GrpStop. The axes group is enabled but cannot accept coordinated motion commands while in the Stopping state. The axes group remains in the Stopping state while MC_GrpStop is executing and will remain in the Stopping state while MC_GrpStop's Execute input is held high.
	Data type	BOOL
GroupDisabled ¹	Description	The axis group is in the Disabled state and cannot accept coordinated motion commands.
	Data type	BOOL
ConstantVelocity	Description	True if the commanded path velocity is the same between the current scan of the application program and the previous scan. ConstantVelocity is always TRUE for Direct moves. The commanded path velocity of Direct moves is always zero.
	Data type	BOOL
Accelerating	Description	True if the commanded path velocity is accelerating between the current scan of the application program and the previous scan.
	Data type	BOOL
Decelerating	Description	True if the commanded path velocity is decelerating between the current scan of the application program and the previous scan.
	Data type	BOOL

InPosition	Description	<p>True indicates that the axes group is “in position”. The following must be true for the axes group to be “in position”:</p> <ul style="list-style-type: none"> • The axes group is enabled. • There are no moves in the group’s queue. • The servo loop is closed for each axis in the group. • There are no moves in the individual axis queue for each axis in the group. • The command delta is zero for each axis in the group. • The actual position is within the In-Position Bandwidth of the command position for each axis in the group.
	Data type	BOOL
Error	Description	If True, an error has occurred.
	Data type	BOOL
ErrorID	Description	Indicates the error identifier if the Error output is set to TRUE. See the table in PLCopen Function Block ErrorID Output.
	Data type	BOOL

¹ These outputs are mutually exclusive, meaning only one will be true at a time. All others will be false. Please refer to the Group State Diagrams.

2.3.125 FFLD

2.3.125.1 Coordinated Motion Motion Library

Function	Description
"MC_AxisSetDefaults" (→ p. 462)	Sets the default kinematic parameters for an axis.
"MC_GrpHalt" (→ p. 465)	Performs a controlled motion stop of all the axes in the group
"MC_GrpSetOverride" (→ p. 467)	Sets the velocity factor that is multiplied to the commanded velocity of all axes in the group.
"MC_MoveCircAbs" (→ p. 469)	Commands interpolated circular movement on an axes group to the specified absolute positions.
"MC_MoveCircRel" (→ p. 475)	Commands interpolated circular movement on an axes group to the specified relative positions.
"MC_MoveDirAbs" (→ p. 481)	Commands movement of an axes group to an absolute position regardless of path.
"MC_MoveDirRel" (→ p. 483)	Commands movement of an axes group to a relative position regardless of path.
"MC_MoveLinAbs" (→ p. 486)	Commands interpolated linear movement on an axes group to the specified absolute positions.
"MC_MoveLinRel" (→ p. 491)	Commands interpolated linear movement on an axes group to the specified relative positions.

2.3.125.2.1 MC_AxisSetDefaults

2.3.125.3.2.1 Description

MC_AxisSetDefaults sets the default kinematic variables for "MC_MoveDirAbs" (→ p. 481) and "MC_MoveDirRel" (→ p. 483). These variables are only used with the MC_MoveDir function blocks.

Each axis within the group must have the default kinematic parameters of Velocity, Acceleration, Deceleration, and Jerk set to values greater than zero. A non-zero Jerk value will perform an S-Curve rather than a trapezoidal move. Each axis within the group must have these values set before a direct move can be started.

The function block returns an error if the group state is not GroupStandby or GroupDisabled.

Figure 1-108: MC_AxisSetDefaults

2.3.126 Related Functions

"MC_MoveDirAbs" (→ p. 481), "MC_MoveDirRel" (→ p. 483), "MC_ErrorDescription" (→ p. 407)

2.3.133.1.1.1 Arguments

For more details on how inputs and outputs work, refer to PLCopen Function Blocks - General Rules.

2.3.134 Input

Execute	Description	On the rising edge the command to halt all of the axes in the group is initiated.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axes group in which the axes will be stopped.
	Data type	AXES_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—
Deceleration	Description	The path deceleration rate for all of the axes in the group
	Data type	LREAL
	Range	0 < Deceleration See Limitations on Acceleration and Jerk for more information.
	Unit	n/a
	Default	—
Jerk	Description	Not supported
	Data type	LREAL
	Range	0 ≤ Jerk See Limitations on Acceleration and Jerk for more information.
	Unit	n/a
	Default	—

2.3.135 Output

Done	Description	If True, then the command completed successfully.
	Data type	BOOL
Busy	Description	TRUE from the moment the EXECUTE input is TRUE until the time the halt is completed.
	Data type	BOOL
Active	Description	Indicates that the halt is still executing.
	Data type	BOOL
CommandAborted	Description	If True, command was aborted by another FB.
	Data type	BOOL
Error	Description	If True, an error has occurred.
	Data type	BOOL
ErrorID	Description	Indicates the error identifier if Error output is set to TRUE.. See table in PLCopen Function Block ErrorID Output.
	Data type	INT

```

2.3.145 FBD

2.3.146 FFLD

2.3.146.1.1 MC_MoveCircAbs

2.3.146.2.2.1 Description

MC_MoveCircAbs commands interpolated circular movement on an axes group to the specified absolute positions in the coordinate system as specified by the 'CoordSystem' argument. See Circular Moves Diagrams for detailed information on the movement options.

NOTE

- An error is returned if the group is in the GroupDisabled state.
- An error is returned if the input parameters do not meet the required precision. See Precision Requirements for Circular Move Input Parameters for more information.

NOTE

Circular motion is only supported for axes groups with only two attached axes.

When all motion has completed successfully, the state of the axes group goes to GroupStandby.

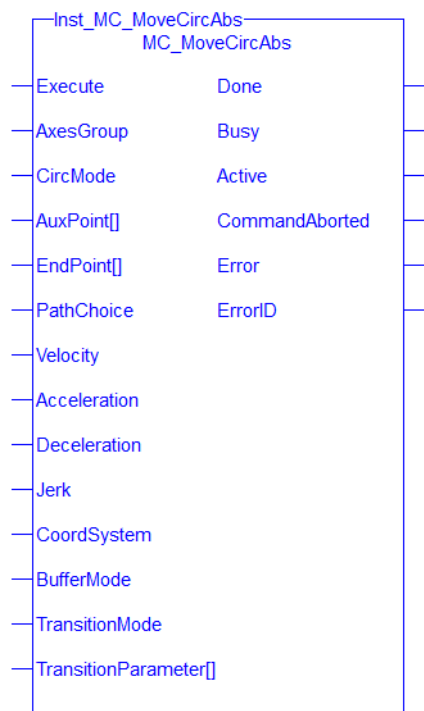

Figure 1-110: MC_MoveCircAbs

	Unit	n/a
	Default	—
CircMode	Description	Specifies the meaning of the AuxPoint[] input.

	Data type	SINT
		One of the following enumeration values:
		<ul style="list-style-type: none"> • MC_CIRC_MODE_BORDER = 0 • MC_CIRC_MODE_CENTER = 1
	Range	n/a
	Unit	n/a
	Default	—
AuxPoint[]	Description	<p>Array of absolute positions for each axis in the group. The meaning depends on the value of the CircMode input:</p> <ul style="list-style-type: none"> • MC_CIRC_MODE_BORDER: AuxPoint defines a point on the circle which is crossed on the path from the starting to the end point. • MC_CIRC_MODE_CENTER: AuxPoint defines the center point of the circle.
	Data type	LREAL
	Range	[0, Number of axes in group - 1]
	Unit	n/a
	Required Precision	1 part in 100,000. See Precision Requirements for Circular Move Input Parameters.
	Default	—
EndPoint[]	Description	Array of absolute end positions for each axis in the group
	Data type	LREAL
	Range	[0, Number of axes in group - 1]
	Unit	n/a
	Default	—
	Required Precision	1 part in 100,000. See Precision Requirements for Circular Move Input Parameters.
PathChoice	Description	Specifies the direction of the path. This argument is only relevant when CircMode is MC_CIRC_MODE_CENTER.
	Data type	SINT
		One of the following enumeration values:
		<ul style="list-style-type: none"> • MC_CIRC_PATHCHOICE_CLOCKWISE = 0 = Clockwise • MC_CIRC_PATHCHOICE_COUNTERCLOCKWISE = 1 = Counterclockwise
	Range	n/a
	Unit	n/a

Velocity	Default	—
	Description	Maximum velocity of the defined path
	Data type	LREAL
	Range	$0 < \text{Velocity} < (20 * \text{Acceleration})$ and $0 < \text{Velocity} < (20 * \text{Deceleration})$ See Limitations on Acceleration and Jerk for more information.
Acceleration	Unit	user units per second
	Default	—
	Description	Maximum acceleration
	Data type	LREAL
Deceleration	Range	$0 < \text{Velocity} < (20 * \text{Acceleration})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ²
	Default	—
	Description	Maximum Deceleration
Jerk	Data type	LREAL
	Range	$0 < \text{Velocity} < (20 * \text{Deceleration})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ²
	Default	—
CoordSystem	Description	Maximum jerk LREAL $(\text{Velocity} / 20) < \text{Acceleration} < (2 * \text{Jerk})$ and $(\text{Velocity} / 20) < \text{Deceleration} < (2 * \text{Jerk})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ³
	Default	—
	Description	The coordinate system used when commanding the circular absolute move. Currently, only the ACS coordinate system is supported. See Coordinate Systems to learn more.
	Data type	SINT
	Range	One of the following enumeration values: <ul style="list-style-type: none"> • MC_COORDINATE_SYSTEM_ACS = 0 • MC_COORDINATE_SYSTEM_MCS = 1 • MC_COORDINATE_SYSTEM_PCS = 2

BufferMode	Unit	n/a
	Default	—
	Description	<p>Defines the chronological sequence of the function block relative to the previous block.</p> <p>The blending modes (2, 3, 4, & 5) match the path velocity at the active move's endpoint. Some individual axis velocities may make an abrupt change if the path of the next move travels in a different direction. A transition move may be programmed at the <code>TransitionMode</code> input to avoid this.</p> <p>See the table in Buffer Modes.</p>

```

2.3.152 FBD

2.3.153 FFLD

2.3.153.1.1 MC_MoveCircRel

2.3.153.2.2.1 Description

MC_MoveCircRel commands interpolated circular movement on an axes group to the specified relative positions in the coordinate system as specified by the 'CoordSystem' argument. See Circular Moves Diagrams for detailed information on the movement options.

NOTE

An error is returned if the group is in the GroupDisabled state.

NOTE

Circular motion is only supported for axes groups with only two attached axes.

When all motion has completed successfully, the state of the axes group goes to GroupStandby.

2.3.154.1.1.1 Arguments

2.3.155 Input

Execute	Description	On the rising edge request to perform a circular relative move.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axis group that will perform the circular relative move
	Data type	AXIS_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—
CircMode	Description	Specifies the meaning of the AuxPoint[] input (see AuxPoint[] below).

	Data type	SINT
		One of the following enumeration values:
		<ul style="list-style-type: none"> • MC_CIRC_MODE_BORDER = 0 • MC_CIRC_MODE_CENTER = 1
	Range	n/a
	Unit	n/a
	Default	—
AuxPoint[]	Description	<p>Array of relative positions for each axis in the group. The meaning depends on the value of the CircMode input:</p> <ul style="list-style-type: none"> • MC_CIRC_MODE_BORDER: AuxPoint defines a point on the circle which is crossed on the path from the starting to the end point. • MC_CIRC_MODE_CENTER: AuxPoint defines the center point of the circle. <p>In all cases the points are relative to the starting point.</p>
	Data type	LREAL
	Range	[0, Number of axes in group - 1]
	Unit	n/a
	Default	—
	Required Precision	1 part in 100,000. See Precision Requirements for Circular Move Input Parameters.
EndPoint[]	Description	Array of relative end positions for each axis in the group.
	Data type	LREAL
	Range	[0, Number of axes in group - 1]
	Unit	n/a
	Default	—
	Required Precision	1 part in 100,000. See Precision Requirements for Circular Move Input Parameters.
PathChoice	Description	Specifies the direction of the path. This argument is only relevant when CircMode is MC_CIRC_MODE_CENTER.
	Data type	SINT
		One of the following enumeration values:
		<ul style="list-style-type: none"> • MC_CIRC_PATHCHOICE_CLOCKWISE = 0 = Clockwise • MC_CIRC_PATHCHOICE_COUNTERCLOCKWISE = 1 = Counterclockwise
	Range	n/a
	Unit	n/a
	Default	—
Velocity	Description	Maximum velocity of the defined path

	Data type	LREAL
	Range	$0 < \text{Velocity} < (20 * \text{Acceleration})$ and $0 < \text{Velocity} < (20 * \text{Deceleration})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second
	Default	—
Acceleration	Description	Maximum acceleration
	Data type	LREAL
	Range	$0 < \text{Velocity} < (20 * \text{Acceleration})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ²
	Default	—
Deceleration	Description	Maximum Deceleration
	Data type	LREAL
	Range	$0 < \text{Velocity} < (20 * \text{Deceleration})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ²
	Default	—
Jerk	Description	Maximum jerk
	Data type	LREAL
	Range	$(\text{Velocity} / 20) < \text{Acceleration} < (2 * \text{Jerk})$ and $(\text{Velocity} / 20) < \text{Deceleration} < (2 * \text{Jerk})$ See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ³
	Default	—
CoordSystem	Description	The coordinate system used when commanding the circular relative move Currently, only the ACS coordinate system is supported. See Coordinate Systems to learn more.
	Data type	SINT
	Range	One of the following enumeration values: <ul style="list-style-type: none"> • MC_COORDINATE_SYSTEM_ACS = 0 • MC_COORDINATE_SYSTEM_MCS = 1 • MC_COORDINATE_SYSTEM_PCS = 2
	Unit	n/a
	Default	—

BufferMode

Description	Defines the chronological sequence of the function block relative to the previous block. The blending modes (2, 3, 4, & 5) match the path velocity at the active move's endpoint. Some individual axis velocities may make an abrupt change if the path of the next move travels in a different direction. A transition move may be programmed at the <code>TransitionMode</code> input to avoid this.
Data type	SINT One of the following enumeration values: <ul style="list-style-type: none"> • MC_BUFFER_MODE_ABORTING = 0 = Abort • MC_BUFFER_MODE_BUFFERED = 1 = Buffered • MC_BUFFER_MODE_BLENDING_PREVIOUS = 2 = Blending Previous • MC_BUFFER_MODE_BLENDING_NEXT = 3 = Blending Next • MC_BUFFER_MODE_BLENDING_LOW = 4 = Blending Low • MC_BUFFER_MODE_BLENDING_HIGH = 5 = Blending High
Range	—
Unit	n/a
Default	—

TransitionMode

Description	Coupled with the <code>TransitionParameter[]</code> , this input defines the shape and dynamics of the inserted contour to connect the current motion with the next motion in the queue. See Transition Between Moves for additional information.
Data type	SINT
Range	The value is limited to the following: <ul style="list-style-type: none"> • MC_TRANSITION_MODE_NONE = 0 • MC_TRANSITION_MODE_CORNER_DISTANCE = 3
Unit	n/a
Default	—

TransitionParameter[]

Description	This array is dependent on the <code>TransitionMode</code> specified. The transition parameter values are applied to the axis group. See table: " Transition Mode Parameters " for details.
Data type	LREAL
Range	[1, N] N values are supplier specified dependent on the <code>TransitionMode</code> selected.
Unit	n/a

Default —

	Default	—
Distance[]	Description	Array of distances for each axis in the group.
	Data Type	LREAL
	Range	n/a
	Unit	user units
	Default	—
Velocity	Description	Maximum velocity of the defined path
	Data Type	LREAL

	Range	0 < Velocity < (20 * Acceleration) and 0 < Velocity < (20 * Deceleration) See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second
	Default	—
Acceleration	Description	Maximum acceleration
	Data Type	LREAL
	Range	0 < Velocity < (20 * Acceleration) See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ²
	Default	—
Deceleration	Description	Maximum deceleration
	Data Type	LREAL
	Range	0 < Velocity < (20 * Deceleration) See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ²
	Default	—
Jerk	Description	Maximum jerk
	Data Type	LREAL
	Range	(Velocity / 20) < Acceleration < (2 * Jerk) and (Velocity / 20) < Deceleration < (2 * Jerk) See Limitations on Acceleration and Jerk for more information.
	Unit	user units per second ³
	Default	—
CoordSystem	Description	The coordinate system used when commanding the linear relative move Currently, only the ACS coordinate system is supported. See Coordinate Systems to learn more.
	Data Type	SINT
	Range	One of the following enumeration values: <ul style="list-style-type: none"> • MC_COORDINATE_SYSTEM_ACS = 0 • MC_COORDINATE_SYSTEM_MCS = 1 • MC_COORDINATE_SYSTEM_PCS = 2
	Unit	n/a
	Default	—

BufferMode	Description	<p>Defines the chronological sequence of the function block relative to the previous block.</p> <p>MC_BUFFER_MODE_ABORTING = 0 = Abort MC_BUFFER_MODE_BUFFERED = 1 = Buffered MC_BUFFER_MODE_BLENDING_PREVIOUS = 2 = Blending Previous MC_BUFFER_MODE_BLENDING_NEXT = 3 = Blending Next MC_BUFFER_MODE_BLENDING_LOW = 4 = Blending Low MC_BUFFER_MODE_BLENDING_HIGH = 5 = Blending High</p> <p>The buffer mode is limited to MC_BUFFER_MODE_BUFFERED for groups with more than two axes.</p> <p>The blending modes (2, 3, 4, & 5) match the path velocity at the active move's endpoint. Some individual axis velocities may make an abrupt change if the path of the next move travels in a different direction. A transition move may be programmed at the <code>TransitionMode</code> input to avoid this.</p> <p>See the table in Buffer Modes</p>
	Data Type	SINT
	Range	—
	Unit	n/a
	Default	—
TransitionMode	Description	<p>Coupled with the <code>TransitionParameter[]</code>, this input defines the shape and dynamics of the inserted contour to connect the current motion with the next motion in the queue.</p> <p>See <code>Transition Between Moves</code> for additional information.</p>
	Data Type	SINT
	Range	<p>The value is limited to the following:</p> <ul style="list-style-type: none"> • MC_TRANSITION_MODE_NONE = 0 • MC_TRANSITION_MODE_CORNER_DISTANCE = 3
	Unit	n/a
	Default	—
TransitionParameter[]	Description	<p>This array is dependent on the <code>TransitionMode</code> specified. The transition parameter values are applied to the axis group. See table: "Transition Mode Parameters" for details.</p>
	Data Type	LREAL

Range	[0, N] The value of N is dependent on the TransitionMode specified.
Unit	n/a
Default	—

2.3.184 Output

Done	Description	If True, then the command completed successfully.
	Data type	BOOL
Busy	Description	If True, then the function block is executing.
	Data type	BOOL
Active	Description	If True, then the function block is still controlling motion.
	Data type	BOOL
CommandAborted	Description	If True, then the command was aborted by another function block.
	Data type	BOOL
Error	Description	If True, then an error has occurred
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE. See table in PLCopen Function Block ErrorID Output
	Data type	INT

2.3.184.1.1.1 Example

2.3.185 Structured Text

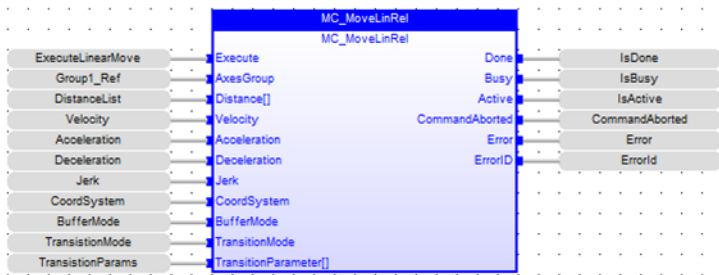

```
(* Inst_MC_MoveLinRelST example *)

Inst_MC_MoveLinRel( ExecuteLinearMove, Group1_Ref, DistanceList, Velocity, Acceleration, Deceleration, Jerk, CoordSystem, BufferMode, TransitionMode, TransitionParams );

2.3.188 FFLD

2.3.188.1 Coordinated Motion Reference Library

Function	Description
"MC_GrpSetPos" (→ p. 496)	Sets the position of the group.

2.3.188.2.1 MC_GrpSetPos

2.3.188.3.2.1 Description

MC_GrpSetPos sets the axis command position for all of the axes in an axes group to the positions specified in the `Position` input. This function block does not cause any motion. The axes group must be enabled and in Standby mode for MC_GrpSetPos to execute. If it is not, this FB will return an error and the axis positions will remain unchanged. The command position is that returned by the Function Block MC_GrpReadCmdPos.

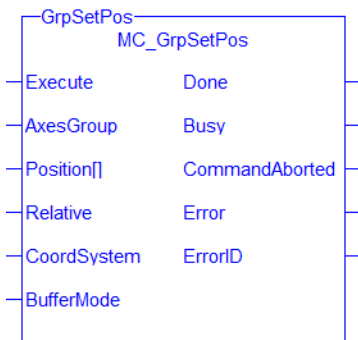

Figure 1-116: MC_GrpSetPos

2.3.189.1.1.1 Arguments

2.3.190 Input

Execute	Description	On the rising edge, request to set the position of the group
	Data Type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
AxesGroup	Description	The axis group for which to set the positions
	Data Type	AXIS_GROUP_REF
	Range	n/a
	Unit	n/a
	Default	—
Position[]	Description	An array containing the position for each axis in the group. If "Relative" is set, position represents a distance rather than an absolute position. The length of the array must equal the maximum number of axes allowed in the group. The maximum number of axes is an argument to MC_CreateAxesGrp, which is used to create axes groups.
	Data Type	LREAL
	Range	[0, Number of axes in group-1]
	Unit	n/a
	Default	—
Relative	Description	Request to set relative (1) or absolute (0) position
	Data Type	BOOL
	Range	1, 0
	Unit	n/a
	Default	—
CoordSystem	Description	The coordinate system used when setting the positions.
	Data Type	SINT
	Range	One of the following enumeration values: <ul style="list-style-type: none"> • MC_COORDINATE_SYSTEM_ACS = 0 • MC_COORDINATE_SYSTEM_MCS = 1 • MC_COORDINATE_SYSTEM_PCS = 2 <p>Currently, only the ACS coordinate system is supported. See Coordinate Systems for more information.</p>
	Unit	n/a
	Default	—
BufferMode	Description	Currently unused
	Data Type	SINT

Range	[0, 0]
Unit	n/a
Default	—

2.3.191 Output

Done	Description	If True, then the command completed successfully.
	Data Type	BOOL
Busy	Description	Currently unused, returns FALSE
	Data Type	BOOL
CommandAborted	Description	Currently unused, returns FALSE
	Data Type	BOOL
Error	Description	If True, an error has occurred.
	Data Type	BOOL
ErrorID	Description	Indicates the error identifier if Error output is set to TRUE. See the table in PLCopen Function Block ErrorID Output.
	Data Type	INT

3 Fieldbus Library

3.1 EtherCAT Library	501
3.2 Profibus Library	520

3.1 EtherCAT Library

Name	Object Type	Description
DriveParamRead	SDO	Reads a drive parameter (ASCII format)
DriveParamWrite	SDO	Writes a drive parameter (ASCII format)
ECATGetObjVal	PDO	Reads cyclic drive parameter (String format) by returning the value of an EtherCAT PDO element
ECATGetStatus	PDO	Reads cyclic status word (Index 6041)
ECATReadData	PDO	Reads cyclic parameter (byte offset format)
ECATReadSdo	SDO	Reads parameter (32 bit format) using SDO command
ECATSetControl	PDO	Manipulates the state of a drive by setting its control word (Index 6040)
ECATWriteData	PDO	Writes cyclic parameter (byte offset format)
ECATWriteSdo	SDO	Writes parameter (32 bit format) using SDO command

Table 1-4: List of EtherCAT FB

The four EtherCAT SDO function blocks are activated by the CANopen over EtherCAT ([CoE](#)) protocol in a client/server mode.

- The client (aka EtherCAT master) is the KAS Runtime application
- The servers (aka EtherCAT slaves) are the drives and I/O nodes where data can be retrieved

The SDO function blocks only support the reading and writing of 32-bit values. It is the fundamental size of CANopen SDO calls.

Why use ECATReadSdo and ECATWriteSdo FBs?

The ECATReadSdo and ECATWriteSdo response time is faster and therefore is typically preferred over the DriveParamRead and DriveParamWrite.

Why use the DriveParam FBs?

The two reasons to prefer the DriveParam FBs are:

- They allow direct use of the parameter name (e.g. IL.LIMITP instead of the SDO index: 356Eh)
- They can be used to setup a drive terminal in the HMI application (which is similar to the [Terminal](#) view available in the AKD widget embedded in the KAS IDE)

See some **stats** about the CPU load

Increase of CPU load when calling SDO function blocks

	Mid-range AKC (Celeron 1.2GHz)	High-range AKC (Core 2 Duo 1.86GHz)
Mean	60 μ s	30 μ s
Min	48 μ s	24 μ s
Max	64 μ s	38 μ s

(these values have been computed with the TraceTimes command)

3.1.1 EtherCAT Library - Drive

These function blocks are used to work with drive parameters that are not supported by ML and MC function blocks.

They support reading and writing drive parameters using the non-cyclic SDO channel in the EtherCAT network. The ASCII name for the parameter is used as an input.

3.1.1.1.1 Execution Time

These function blocks typically take a longer time to execute (up to ten cycles to finish executing). It takes the same amount of time to Read or Write a parameter.

NOTE

It takes more than one cycle to execute these function blocks (but less than 100 ms).

3.1.1.2.2.1 Reason

It is not only linked to the SDO ASCII communication. Because these FBs are waiting for the AKD drive to respond, the execution time can also increase due to the load of the AKD firmware at the time you call them.

3.1.1.3.3.2 Result

The PLC code is overrunning the cycle duration. as explained in paragraph "**Tasking Model / Scheduling**". As a consequence, you can see the following message in the Controller Log window:

"The Virtual Machine missed 1 cycle(s) of PLC execution"

3.1.1.4.4.3 Solution

When this happens we recommend to:

- Use these function blocks sparingly in programs
- Rely on the EtherCAT read/write SDO function blocks whenever possible
- Smooth the load of the PLC code by executing these function blocks at the required update rate.

See some [stats](#) about the FB execution time

- There is a small difference in timing when running EtherCAT at 2ms compared to other frequencies.

	0.25, 0.5, 1ms	2ms
Mean	9ms	14ms
Min	3ms	8ms
Max	16ms	24ms

- **Max** time to consider when executing a single SDO command, (i.e. before the Done output becomes true): **24ms**.
- **Max** time to consider when executing a single Drive Parameter command (i.e. before the Done output becomes True): **60 ms**

	4 kHz	1 kHz
Mean	20 ms	11 ms
Min	15 ms	9 ms
Max	45 ms	58 ms

- When sending multiple commands to a single drive, only one command can be sent at a time. Therefore the time to execute multiple commands is:
Number of commands x Execution time of a single command
- When commands are sent to different AKD drives at the same time, the requests do not interfere with each other. So you can be confident the function finishes execution in the same max time as to one drive.

3.1.1.5 DriveParamRead

3.1.1.6.1 Description

This function block reads a drive parameter by sending an ASCII command to a drive.

See also some **stats** about the execution time [here](#).

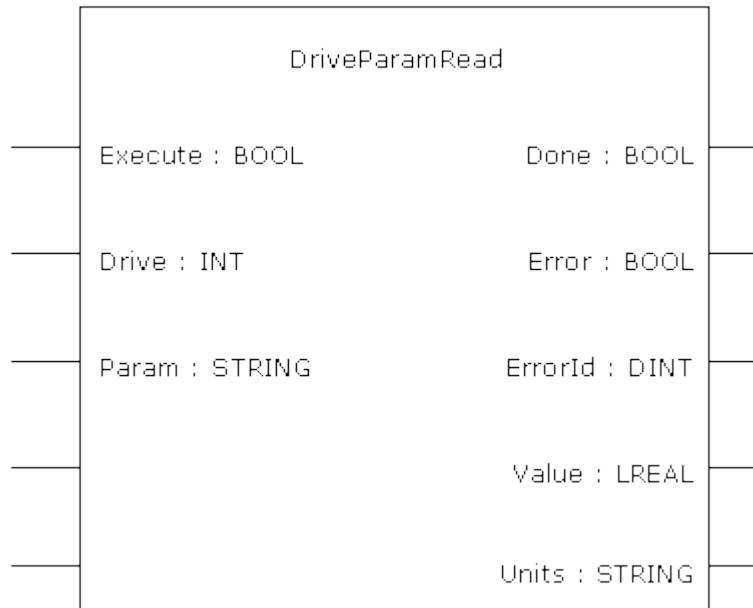

Figure 1-117: DriveParamRead

NOTE

This function block uses *and reserves* the EtherCAT SDO Channel. The SDO Channel will remain reserved until the done output is "true". Therefore, this FB should be called at each cycle until the done output is true. If it is not called at each cycle the rest of SDO communication (the AKD GUI Views, for example) will be blocked.

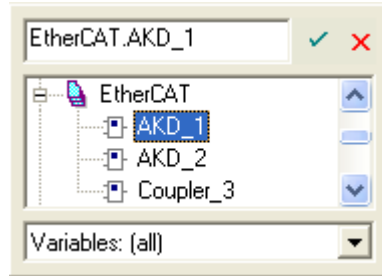

Using this FB in SFC P0 or P1 steps is not recommended as these steps are executed only once. If this FB is used in P0 or P1 then it must be used in an SFC N step to ensure the FB completes.

3.1.1.7.2 Arguments

3.1.1.8.3.1 Input

Execute	Description
	On the rising edge of Execute, a drive parameter is read. The function block only handles one request at a time. If Execute is toggled quickly so that another rising edge occurs before the function block has completed, the function block does not issue a second read command.
	Data type BOOL
	Range 0, 1
	Unit n/a
	Default —

Drive **Description** The address of the drive from which data is read.
 The first node usually has the value '1001'. The second node usually has the value '1002'.
 Alternately, you can use the members of the EtherCAT structure to specify a drive's address when you [create the variable](#).

Data type INT
Range —
Unit n/a
Default —

Param **Description** The parameter to read.
Data type STRING
Range —
Unit n/a
Default —

3.1.1.9.4.2 Output

Done **Description** Indicates whether the DriveParamRead function block has completed without error.
Data type BOOL
Unit n/a

Error **Description** Indicates whether the DriveParamRead function block call has completed with error:
Data type BOOL
Unit n/a

ErrorID **Description** The DriveParamRead error result if Error is TRUE (see list of Error Codes in table below). Upon success, Error is set to zero.
Data type DINT
Unit n/a

Value **Description** The value of the drive parameter. Value is only set when the function block has successfully completed.
Data type LREAL
Unit n/a

Units **Description** The units of the drive parameter. Value is only set when the function block has successfully completed.
Data type STRING
Unit n/a

Error Code	Value, dec (hex)	Description
ECERR_OK	0	The SDO call succeeded

Error Code	Value, dec (hex)	Description
ECERR_DEVICE_INVALIDINDEX	1795 (0x703)	An invalid value for the Index input was specified
ECERR_DEVICE_INVALIDACCESS	1796 (0x704)	Reading of the variable is not permitted
ECERR_DEVICE_INVALIDDATA	1798 (0x706)	Invalid parameter value(s) in SDO index and/or sub-index
ECERR_DEVICE_NOTREADY	1799 (0x707)	device is not in a ready state, network is not in operational
ECERR_DEVICE_NOTFOUND	1804 (0x70C)	EtherCAT device not found
ECERR_DEVICE_SYNTAX	1805 (0x70D)	An unexpected error occurred
ECERR_DEVICE_INVALIDSTATE	1810 (0x712)	The EtherCAT device is in an invalid state
ECERR_DEVICE_TIMEOUT	1817 (0x719)	The EtherCAT device failed to respond, timing out
ECERR_DEVICE_INSERTMAILBOX	1826 (0x722)	Error while inserting the mailbox command into internal FIFO
ECERR_DEVICE_UNKNOWNMAILBOXCMD	1828 (0x724)	The master sent an unknown mailbox command to the slave
ECERR_DEVICE_INVALIDADDR	1832 (0x728)	Can't send a mailbox command to the specified slave
ECERR_DEVICE_INVALIDOFFSET	1827 (0x723)	An invalid value for the SubIndex input was specified
ECERR_DEVICE_PARAM_ACCESS_ERROR	1920 (0x780)	Unknown error occurred while accessing parameter
ECERR_DEVICE_PARAM_NOT_FOUND	1921 (0x781)	Parameter was not found
ECERR_DEVICE_PARAM_NOT_INTEGER	1922 (0x782)	Parameter is a floating-point value. Integer value required.
ECERR_DEVICE_VALUE_IS_NEGATIVE	1923 (0x783)	No negative values allowed. Value specified was negative.
ECERR_DEVICE_VALUE_OUT_OF_RANGE	1924 (0x784)	Value is out of data-range
ECERR_DEVICE_VALUE_GREATER_THAN_MAX	1925 (0x785)	Value bigger than maximum
ECERR_DEVICE_VALUE_LOWER_THAN_MIN	1926 (0x786)	Value lower than minimum
ECERR_CLIENT_ERROR	2048 (0x800)	Error in Mailbox response to a previously sent mailbox command
ECERR_CLIENT_TIMEOUT	2049 (0x801)	The SDO command timed out
ECERR_CLIENT_INVALIDPARM	2050 (0x802)	An invalid value was specified
ECERR_CLIENT_INVALIDSIZE	2051 (0x803)	An invalid value for the size input was specified

Table 1-5: List of EtherCAT Error Codes

3.1.1.10.5 Usage

Use this FB to read drive parameters that are not supported by other function blocks. Examples would be motor temperature, drive bus voltage, Present drive limit settings, present regen loading, drive display, and fault history.

DriveParamWrite

3.1.1.12.7 Example

3.1.1.13.8.1 Structured Text

```
(* Read PL.KP on first AKD Drive on EtherCAT network *)
(* The code continually calls the FB (without re-executing it) until the
first execution is done, then reads the returned value from the drive and
reset the FB *)

IF ReadPropGain then
  Inst_DriveParamRead1( 1, 1001, 'PL.KP' );
End_If;

On Inst_DriveParamRead1.Done do
  Inst_DriveParamRead1( 0, 1001, 'PL.KP' );
  PositionProportionalGain := Inst_DriveParamRead1.Value; (* Reads the
returned value from the drive *)
  ReadPropGain := 0; (* Reset the FB *)
End_DO;
```

3.1.1.14 DriveParamWrite

3.1.1.15.1 Description

This function block writes a drive parameter by sending an ASCII command to a drive.

See also some **stats** about the execution time [here](#).

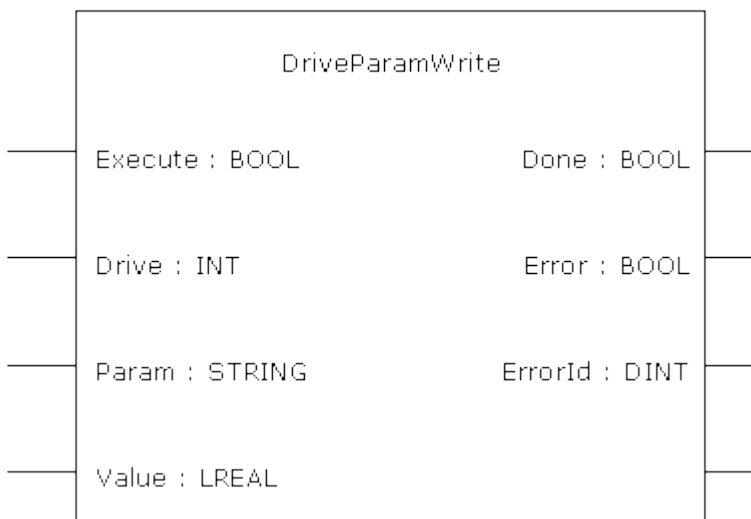

Figure 1-118: DriveParamWrite

NOTE

This function block uses *and reserves* the EtherCAT SDO Channel. The SDO Channel will remain reserved until the done output is "true". Therefore, this FB should be called at each cycle until the done output is true. If it is not called at each cycle the rest of SDO communication (the AKD GUI Views, for example) will be blocked.

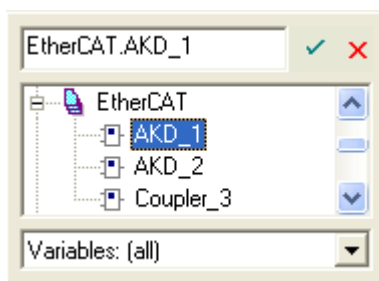

Using this FB in SFC P0 or P1 steps is not recommended as these steps are executed only once. If this FB is used in P0 or P1 then it must be used in an SFC N step to ensure the FB completes.

3.1.1.16.2 Arguments

3.1.1.17.3.1 Input

Execute	Description	On the rising edge of Execute, a drive parameter is set. The function block only handles one request at a time. If Execute is toggled quickly so that another rising edge occurs before the function block has completed, the function block does not issue a second write command.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

Drive	Description	The address of the drive to which data is written to. The first node usually has the value '1001'. The second node usually has the value '1002'. Alternately, you can use the members of the EtherCAT structure to specify a drive's address when you create the variable .

3.1.2.14.4.1 Input

Execute	Description	On the rising edge of Execute, an SDO write command will be issued. The function block will only handle one SDO command at a time. If Execute is toggled quickly so that another rising edge occurs before the SDO command has completed, the function block will not issue a second SDO command.
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—
Index	Description	The object directory index of the data to be written to. For more details, refer to: <ul style="list-style-type: none"> • Communication SDOs • Manufacturer specific SDOs • Profile specific SDOs <p>To read/write an SDO object with an index greater than 16#7FFF (32767), the value must be entered in the form <code>any_to_int(index # in hex format)</code>. For example <code>any_to_int(16#8321)</code>.</p>
	Data type	INT
	Range	—
	Unit	n/a
	Default	—
Subindex	Description	The sub-index of the object directory variable to be written to. For more details, refer to: <ul style="list-style-type: none"> • Communication SDOs • Manufacturer specific SDOs • Profile specific SDOs <p>To read/write an SDO object with an index greater than 16#7FFF (32767), the value must be entered in the form <code>any_to_int(index # in hex format)</code>. For example <code>any_to_int(16#8321)</code>.</p>
	Data type	SINT
	Range	—
	Unit	n/a
	Default	—
Size	Description	The size (number of bytes) to write.
	Data type	SINT
	Range	1 - 4
	Unit	n/a

SlaveAddress **Default** —
Description The EtherCAT address of the slave from which data will be written to.
 The first node usually has the value '1001'. The second node usually has the value '1002'.
 Alternately, you can use the members of the EtherCAT structure to specify a drive's address when you [create the variable](#).

Value **Data type** INT
Range —
Unit n/a
Default —
Description The value to write to the object directory variable.
Data type DINT
Range [-2147483648, 2147483648]
Unit n/a
Default —

3.1.2.15.5.2 Output

Done **Description** Indicates whether the SDO call has completed without error.
Data type BOOL
Unit n/a

Error **Description** Indicates whether the SDO call has completed with error:
Data type BOOL
Unit n/a

ErrorID **Description** The SDO call error result, if Error is TRUE (see). Upon success, Error is set to zero.
Data type DINT
Unit n/a

3.1.2.16.6 Related Functions

[ECATReadSDO](#)

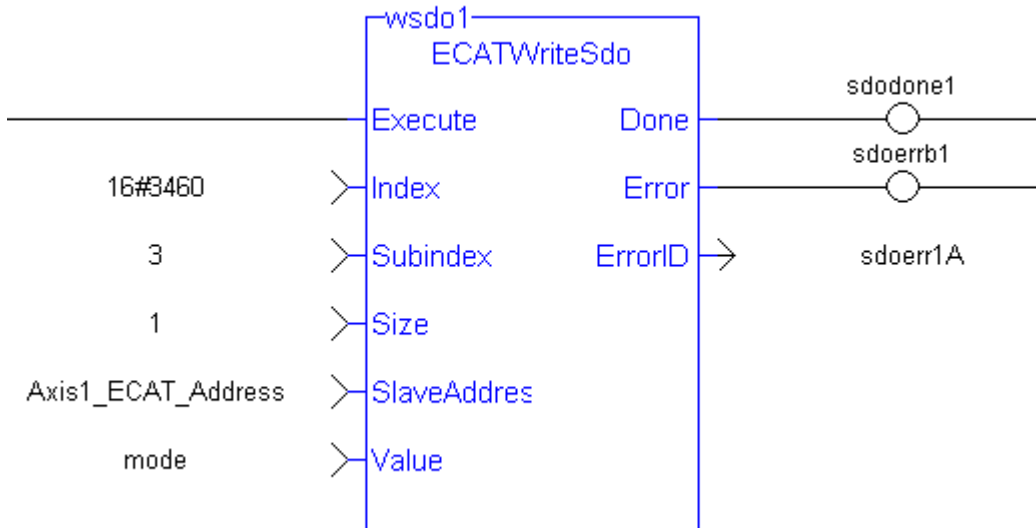

3.1.2.17.7 Example

3.1.2.18.8.1 Structured Text

```
(* Write 58.000 to PL.KP of first AKD Drive on EtherCAT network *)
Inst_ECATWriteSdo( TRUE, 16#3542, 0, 4, 1001, 58000 );
```

```
(* Write a value of 246 to the 4 byte data in SDO index 8321h (33569
decimal), sub-index 1 on the first AKD Drive *)
Inst_ECATWriteSdo( TRUE, any_to_int(16#8321), 1, 4, 1001, 246 );
```

3.1.2.19.9.2 Ladder Diagram

3.1.3 EtherCAT Library - Debug

The following function blocks support advanced functionality typically used for diagnostic support. Most information available in these function blocks is also available in a ML and MC function block.

3.1.3.1 ECATReadData

⚠ IMPORTANT

This is a low level function and it should only be used carefully by **advanced users**.

3.1.3.2.1 Description

This function allows a direct access to the memory [image](#) of the EtherCAT frame which is sent or received when you need to debug your application. You access the EtherCAT image element by giving the offset in the image and the size of the element.

If you have a device other than the drive, ECATReadData is used for more than just debug. It is used to get the status of the module (e.g. Stepper I/O slice).

3.1.3.3.2 Arguments

3.1.3.4.3.1 Input

Offset	Description	Offset in bytes from the beginning of the frame
	Data type	UINT
	Range	0-size of frame (maximum size of an Ethernet frame is 1500)
	Unit	bytes
	Default	—

Nbytes	Description	Number of bytes to read
	Data type	SINT
	Range	1, 2 or 4
	Unit	bytes
	Default	—
Direction	Description	Direction of the frame (true = output image, false = input image).
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

NOTE

The valid ranges for the **Value** parameter are:

For 1 byte: 0 to 255

For 2 bytes: 0 to 65535

For 4 bytes: - 2147483648 to 2147483648 (The sign bit represents the most significant bit in the data word)

3.1.3.5.4.2 Output

Value	Description	Value of the EtherCAT frame
	Data type	DINT
	Unit	n/a

3.1.3.6.5 Related Functions

[ECATGetObjVal](#)

3.1.3.7.6 Example**3.1.3.8.7.1 Structured Text**

```
// Read 4 bytes starting at offset 26 of the output image
```

```
Position := ECATReadData(26, 4, true);
```

3.1.3.9 ECATWriteData**ⓘ IMPORTANT**

This is a low level function and it should only be used carefully by **advanced users**.

3.1.3.10.1 Description

Modify the EtherCAT process image by directly writing values in it.

If you have a device other than the drive, ECATWriteData is used for more than just debug. It is used to set the status of the module (e.g. Stepper I/O slice) in the case your project is based on an external XML file because it contains unsupported EtherCAT Device.

3.1.3.11.2 Arguments

3.1.3.12.3.1 Input

Offset	Description	Offset in bytes from the beginning of the frame
	Data type	UINT
	Range	0 - 1500
	Unit	bytes
	Default	—
Nbytes	Description	Number of bytes to write
	Data type	SINT
	Range	1, 2 or 4
	Unit	bytes
	Default	—
Value	Description	Value to be written in the image. Only the number of bytes specified by Nbytes is copied.
	Data type	DINT
	Range	[-2147483648, 2147483648]
	Unit	n/a
	Default	—

NOTE

The valid ranges for the **Value** parameter are:

For 1 byte: 0 to 255

For 2 bytes: 0 to 65535

For 4 bytes: - 2147483648 to 2147483648 (The sign bit represents the most significant bit in the data word)

3.1.3.13.4.2 Output

Default (.Q)	Description	True if data was written
	Data type	BOOL
	Unit	n/a

3.1.3.14.5 Related Functions

[ECATReadData](#)

3.1.3.15 ECATGetObjVal**NOTE**

This function is deprecated as of KAS v2.7. The recommended best practice is to map a PLC variable to a PDO object.

3.1.4 EtherCAT Library - Status

The following function blocks support advanced functionality typically used for diagnostic support.

Most information available in these function blocks is also available in ML and MC function blocks.

3.1.4.1 ECATGetStatus (Function)**3.1.4.2.1 Description**

Return the status word of the designated drive (SDO 0x6041).

The status machine for the status word corresponds to the CANopen status machine.

The Function Block receives the status word through the cyclic EtherCAT PDO communications. The status word is captured in every instance of fixed PDO mapping.

3.1.4.3.2 Arguments

3.1.4.4.3.1 Input

Address	Description	EtherCAT address of the drive
	Data type	DINT
	Range	[0, 65535]
	Unit	n/a
	Default	—

3.1.4.5.4.2 Output

Status	Description	Status word of the drive as defined in the EtherCAT profile for the S300/S400/S600/S700. Compatible with CiA 402 definition of status word (CANopen object 0x6041).
	Data type	UINT
	Unit	n/a

3.1.4.6.5 Related Functions

[ECATSetControl](#)

3.1.4.7.6 Example

3.1.4.8.7.1 Structured Text

```
(*****)
(* read EtherCAT axis status (Bit3: Fault, Bit7: Warning) *)
(*****)

ECATStatus := ECATGetStatus(AxisAddress); //Read the ECAT Status Word
(SDO 6041) of the Axis

IF AxisAddress > 1000 THEN
(*****)
(* timer to read cyclically SDOs *)
(*****)
```

3.1.4.9 ECATSetControl (Function)

3.1.4.10.1 Description

Manipulate the state of a drive by setting its control word (SDO 06040).

The status machine for the control word corresponds to the CANopen Status Machine.

The Function Block transmits the control word through the cyclic EtherCAT PDO communications. The control word is captured in every instance of fixed PDO mapping.

3.1.4.11.2 Arguments

3.1.4.12.3.1 Input

Address	Description	EtherCAT address of the drive
	Data type	DINT
	Range	[0, 65535]
	Unit	n/a
	Default	—
Control	Description	Control word of the drive as defined in the EtherCAT profile for the S300/S400/S600/S700. Compatible with CiA 402 definition of control word (CANopen object 0x6040).
	Data type	UINT
	Range	—
	Unit	n/a
	Default	—

3.1.4.13.4.2 Output

Default (.Q)	Description	Returns true when function successfully executes (i.e. if the control word was successfully set)
	Data type	BOOL
	Unit	n/a

3.1.4.14.5 Related Functions

[ECATGetStatus](#)

3.2 Profibus Library

The Profibus driver has a thread that performs the exchange with the HW from time to time. The minimal exchange period (as well as the thread system priority) can be configured.

Name	Description
PBGetExchPrio PBSetExchPrio	Return or change the priority of the I/O exchange thread. Which can be: <ul style="list-style-type: none"> • #define CIF_EXCHANGE_PRIORITY_NORMAL 0 /* Profibus exchange thread priority lower than VM thread priority */ • #define CIF_EXCHANGE_PRIORITY_HIGHER 1 /* Profibus exchange thread priority equal to VM thread priority */
PBGetExchPeriod PBSetExchPeriod	Return or change the minimum period of the I/O exchange thread with the HW (in PLC cycles). 2 is the minimum value. Taking the system load into account, it can be set to more than 2. <i>Example:</i> set the period to 2 if you want the exchange to be performed at the most once every 2 cycles (compared with the VM cycle)
PBGetExchNb	Return the amount of exchange performed with the HW
PBGetLastPeriod	Return the last period between two exchanges
PBGetMaxPeriod	idem but max period

Name	Description
PBResetStats	<p>Reset the previous statistics of the I/O exchange thread. Which are:</p> <ul style="list-style-type: none">• the number of exchanges done• the last exchange period• the maximum exchange period <p>Statistics are reset each time the driver is Open (i.e. when the program start)</p>

Table 1-6: List of Profibus FB

4 System Library

4.1 PrintMessage	523
4.2 GetCtrlErrors	524
4.3 ClearCtrlErrors	525
4.4 GetCtrlInfo	526
4.5 GetCtrlPerf	527

Name	Description
"PrintMessage" (→ p. 523)	Generate an output message in the log windows.
"GetCtrlErrors" (→ p. 524)	Get a list of the active errors and alarms on the controller.
"ClearCtrlErrors" (→ p. 525)	Clears the list of active errors and alarms on the controller.
"GetCtrlPerf" (→ p. 527)	Generate a text file with performance statistics of the controller.
"GetCtrlInfo" (→ p. 526)	Get the serial, model, and/or part number of the controller.

Table 1-7: List of System Functions

4.1 PrintMessage

4.1.1 Description

The PrintMessage block is used to generate a log message with any wanted strings in the Log Messages window.

4.1.1.1 About the Source

PrintMessage use the PLC message type. So, to display all messages generated by PrintMessage, go to the log configuration and select the DEBUG level for the PLC source.

4.1.1.2 About the Level

The message could be sent with a logging level from 0 to 4 that qualifies its importance. The highest level, 4, logs critical messages (available levels are: debug, informational, warning, error and Critical).

Keep in mind that only Error and Critical messages a generated by default. If you want to force the system to generate every message level, go into the log configuration and change the settings to the desired level.

! IMPORTANT

Enabling all messages can slow down the application's execution. To avoid locking up communications between the IDE and Runtime, you must never include a print statement in your program that prints to the log every update cycle.

See at the configuration settings for more details.

4.1.2 Arguments

4.1.2.1 Input

Level	Description	Level of the logged message. In other words, the importance of it. Keep in mind that not all messages are displayed in the log windows by default. Only Error and Critical messages a displayed. So, in order to show lower level, it is needed to change the log settings. PrintMessage logs PLC messages.
	Data type	DINT
	Range	[0, 4] Defines are: LEVEL_DEBUG, LEVEL_INFO, LEVEL_WARNING, LEVEL_ERROR, LEVEL_CRITICAL
	Unit	n/a

Message	Default	—
	Description	Content of the message. A string of 255 characters maximum.
	Data type	String
	Range	1 to 255 characters
	Unit	n/a
	Default	—

4.1.2.2 Output

Default (.Q)	Description	Returns true when function successfully executes
	Data type	BOOL
	Unit	n/a

4.1.3 Usage

```
PrintMessage( LEVEL_DEBUG, 'Message string to be logged' );
```

4.1.4 Example

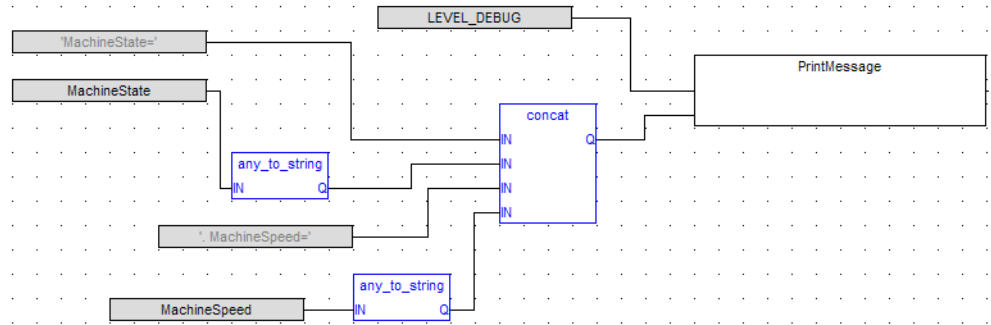

4.1.4.1 Structured Text

```
// It's possible to create a temporary variable with the message.
MESSAGE := CONCAT( 'MachineState=', ANY_TO_STRING(MachineState), '.
MachineSpeed=', ANY_TO_STRING(MachineSpeed) );

// Then print the message to the log window
PrintMessage( LEVEL_INFO, MESSAGE );
PrintMessage( LEVEL_WARNING, MESSAGE );
PrintMessage( LEVEL_ERROR, MESSAGE );

// Or to create the string directly in the function call:
PrintMessage( LEVEL_CRITICAL, CONCAT( 'MachineState=', ANY_TO_STRING
(MachineState), '. MachineSpeed=', ANY_TO_STRING(MachineSpeed) ) );
```

4.1.4.2 Function Block Diagram

4.2 GetCtrlErrors

Returns active errors and alarms on the controller in two arrays of hundred booleans. Every index in the array corresponds to the error and alarm numbers in the tables. See Errors for a list of errors and alarms that may be generated.

4.2.1 Arguments

4.2.1.1 Input

EN	BOOL	Enable
ActiveError	BOOL[100]	Array of bool with the size equal to 100
ActiveAlarm	BOOL[100]	Array of bool with size equal to 100

4.2.1.2 Output

OK	BOOL	
Q	DINT	Status of the execution

Status meaning:

Bit 0	Value 0	No error, no alarm, no shut down
Bit 0	Value 1	There is an active error or an active alarm (i.e. there is something in the array ActiveError/ActiveAlarm)
Bit 1	Value 0	No shut down
Bit 1	Value 1	The PLC processes will be shut down. This will start 10 seconds after the error is triggered
Bit 2-15	Value 2 4 9 to 2147483648	reserved

4.2.2 Examples

4.2.2.1 FBD

4.2.2.2 FFLD

4.2.2.3 ST

```
GetCtrlErrors ( ActErrors (*BOOL*), ActAlarms (*BOOL*) );
```

4.3 ClearCtrlErrors

Clears the active errors and alarms on the controller. Only clearable errors will be cleared. See Errors for a list of errors and alarms that may be generated.

4.3.1 Arguments

4.3.2 Input

EN **Data Type** Enable the function

4.3.3 Output

Q **Data Type** BOOL

NOTE

If clearable and non-clearable errors are present and this function is called, the Output Q will be turned to true but the non-clearable errors will remain.

4.4 GetCtrlInfo

This function block returns a String containing the value of the control parameter requested.

4.4.1 Arguments

4.4.1.1 Input

Execute **Description** Rising edge of enable initiates read of parameter
Data Type BOOL
Range 0, 1
Unit n/a
Default —

Parameter Number **Description** Parameter number to read
Data Type INT
Range [1,3]
Unit n/a
Default 1 = PDMM/PCMM serial number
 2 = PDMM/PCMM model number
 3 = PDMM/PCMM part number0

These parameters are also Internal Defines, as shown in the table below.

#define	CTRLINFO_SERIAL_NUMBER	1
#define	CTRLINFO_MODEL_NUMBER	2
#define	CTRLINFO_PART_NUMBER	3

4.4.1.2 Output

Done	Description	Indication that read completed without error
	Data Type	BOOL
Error	Description	Indication that read completed with error
	Data Type	BOOL
ErrorID	Description	Error value to indicate error condition
	Data Type	INT
		NO Error : 0 Invalid parameter : 1 Error reading data : 2 Not valid on non-PDMM : 3
		These parameters are also Internal Defines, as shown in the table below.

```
#define CTRLINFO_ERROR_NO_ERROR 0
#define CTRLINFO_ERROR_INV_PARAMETER 1
#define CTRLINFO_ERROR_CANT_READ_DATA 2
#define CTRLINFO_ERROR_NOT_PDMM 3
```

Value	Description	String containing data that was read.
	Data Type	STRING

4.4.2 Examples

4.4.2.1 Structured Text

```
Inst_GetCtrlInfo( ExecuteRead, 1);

if Inst_GetCtrlInfo.Done then
    serialNumber := Inst_GetCtrlInfo.Value;
end_if;
```

4.4.2.2 Ladder Diagram

4.5 GetCtrlPerf

4.5.1 Description

This function block returns controller CPU performance statistics.

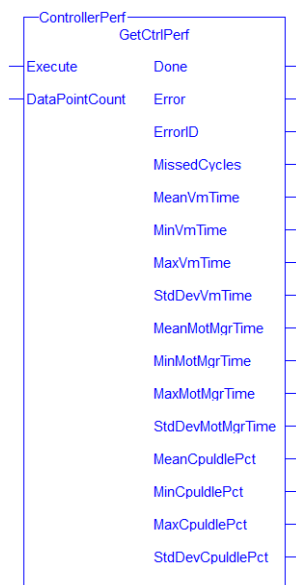

Figure 1-123: GetCtrlPerf

See also:

- Differences Between Functions and Function Blocks
- Calling a function block

4.5.2 Arguments

4.5.2.1 Input

Execute	Description	On the rising edge, request to collect the controller's performance data.
	Data type	BOOL
	Range	0,1
	Unit	n/a
	Default	—
DataPointCount	Description	The number of motion manager cycles over which performance statistics will be gathered.
	Data type	UDINT
	Range	2 - 240,000
	Unit	n/a
	Default	—

4.5.2.2 Output

Done	Description	If True, then the command completed successfully.
	Data type	BOOL
Error	Description	If True, an error has occurred.
	Data type	BOOL
ErrorID	Description	Indicates the error if Error output is set to TRUE. ErrorID = 0 indicates no error, ErrorID = 1 indicates an error
	Data type	INT
MissedCycles	Description	Indicates the number of missing VM cycles.

	Data type	UDINT
MeanVmTime	Description	The mean VM execution time measured in microseconds.
	Data type	LREAL
StdDevVmTime	Description	The standard deviation of the VM execution time measured in microseconds.
	Data type	LREAL
MinVmTime	Description	The minimum VM execution time measured in microseconds.
	Data type	LREAL
MaxVmTime	Description	The maximum VM execution time measured in microseconds.
	Data type	LREAL
MeanMotMgrTime	Description	The mean motion manager execution time measured in microseconds.
	Data type	LREAL
StdDevMotMgrTime	Description	The standard deviation of the motion manager execution time measured in microseconds.
	Data type	LREAL
MinMotMgrTime	Description	The minimum motion manager execution time measured in microseconds.
	Data type	LREAL
MaxMotMgrTime	Description	The maximum motion manager execution time measured in microseconds.
	Data type	LREAL
MeanCpuidlePct	Description	The mean percentage of time the controller CPU is idle.
	Data type	LREAL
StdDevCpuidlePct	Description	The standard deviation of the measurements of the time that the controller CPU is idle.
	Data type	LREAL
MinCpuidlePct	Description	The minimum measurement of the time that the controller CPU is idle.
	Data type	LREAL
MaxCpuidlePct	Description	The maximum measurement of the time that the controller CPU is idle.
	Data type	LREAL

5 Kollmorgen UDFBs

5.1 How to create an instance	533
5.2 Working with Kollmorgen UDFBs	534

A Kollmorgen UDFB¹ is a pre-defined function block created by Kollmorgen to simplify certain tasks or demonstrate a particular function. A Kollmorgen UDFB must be instantiated and unlocked before it may be used.

Name	Description
FB_AKDFitRpt	Outputs AKD fault information
FB_AxisPlsPosModulo	
FB_AxisPlsPosNoModulo	
FB_Cylinder	Control a cylinder and the Limit Switches.
FB_ElapseTime	Keeps track of the time that a Boolean input variable is on.
FB_FirstOrderDigitalFilter	Filter an Analog signal.
FB_PWDutyOutput	Converts an input range to a duty cycle percentage
FB_S700FitRpt	Outputs S700 drive fault Information
FB_ScaleInput	Scale DINT to LREAL
FB_ScaleOutput	Scale DINT to LREAL
FB_TemperaturePID (→ p. 553)	{rovides PID temperature control with auto tuning
MCFB_AKDFault (→ p. 642)	Outputs AKD drive fault Information.
MCFB_AKDFaultLookup (→ p. 644)	String message of the corresponding AKD drive fault number
"MCFB_GearedWebTension" (→ p. 630)	Facilitates dancer and tension control in an electronic geared master/slave machine design
MCFB_Jog	Jog an axis in the selected direction at a defined speed
MCFB_StepAbsolute	Performs a static homing function by setting Actual Position to the position of an absolute encoder
MCFB_StepAbsSwitch	Performs a homing function by searching for an absolute positioned external physical switch
MCFB_StepAbsSwitchFastInput	Performs a homing function by searching for an absolute positioned external physical switch
MCFB_StepBlock	Performs homing against a physical object, mechanically blocking the movement
MCFB_StepLimitSwitch	Performs a single-axis home to a limit switch
MCFB_StepLimitSwitchFastInput	Performs a homing function by searching for an external physical switch
MCFB_StepRefPulse	Performs homing by searching for Zero pulse, Marker, or reference pulse in encoder

¹"User Defined Function Block" UDFB can be used as a sub-function block in another program of the application. It is described using FBD, LD, ST or IL language. Input / output parameters of a UDFB (as well as private variables) are declared in the variable editor as local variables of the UDFB

Name	Description
MLFB_HomeFindHomeFastInput	Performs a single-axis home to a limit switch connected to a High Speed Input
MLFB_HomeFindHomeFastInputModulo	Performs a single-axis home to a limit switch connected to a High Speed Input
MLFB_HomeFindHomeInput	Fast Homing to a home switch
MLFB_HomeFindHomeInputThenZeroAngle	Fast Homing to a home switch + Zero angle
MLFB_HomeFindLimitFastInput	Homing to a limit switch
MLFB_HomeFindLimitFastInputModulo	Homing to a limit switch: Modulo mode
MLFB_HomeFindLimitInput	Homing to a limit switch
MLFB_HomeFindLimitInputThenZeroAngle	Homing to a limit switch + Zero angle
MLFB_HomeFindZeroAngle	Homing to a zero-angle reference
MLFB_HomeMoveUntilPosErrExceeded	Homing until the position error is exceeded
MLFB_HomeMoveUntilPosErrExceededThenZeroAngle	Homing until the position error is exceeded + Zero angle
MLFB_HomeUsingCurrentPosition	Homing using the current position
MLFB_Jog	Jog in a selected direction at a defined speed
MLFB_PlsPosFw	Forward position range indicator
MLFB_PlsPosFwBw	Forward/Backward position range indicator
MLFB_PlsTimeFw	Forward/Backward position/time range indicator
"PipeNetwork_FFLD" (→ p. 550)	Used to call the PNCode function block in FFLD POU's
"ProfilesCode_FFLD" (→ p. 551)	Used to call the ProfilesCode function block in FFLD POU's

Table 1-8: List of System Kollmorgen UDFBs

5.1 How to create an instance

- Open your PLC code
- Select the UDFB in the [Library](#) tree
- Drag-and-drop the UDFB in the PLC editor to create the instance of the UDFB

An instance of the UDFB has now been created in **Subprograms**.

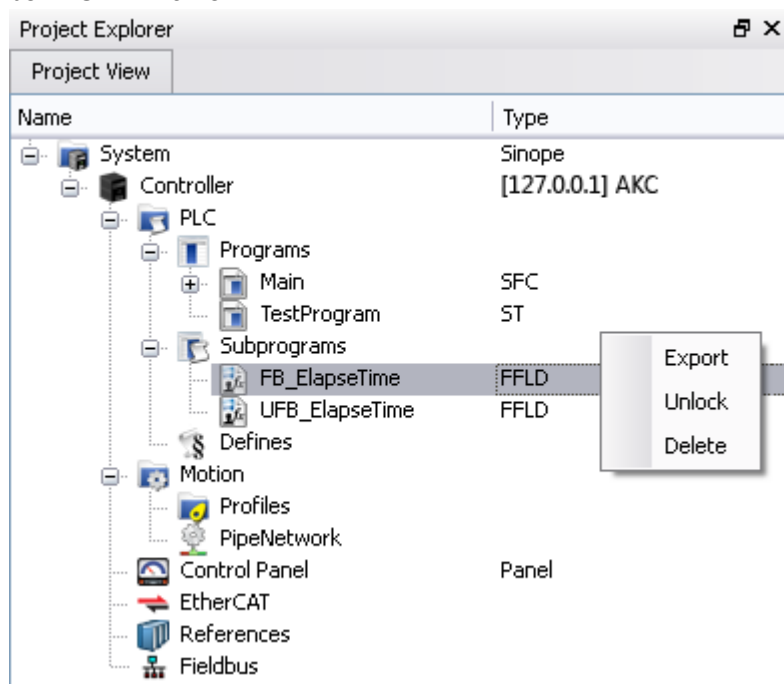

NOTE

You cannot create the instance of the UDFB directly from the dictionary or from the PLC Editor.

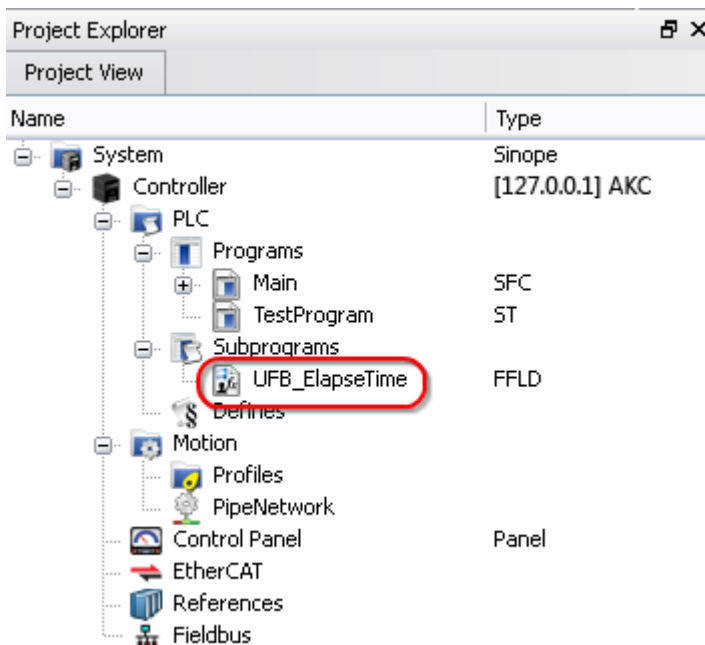

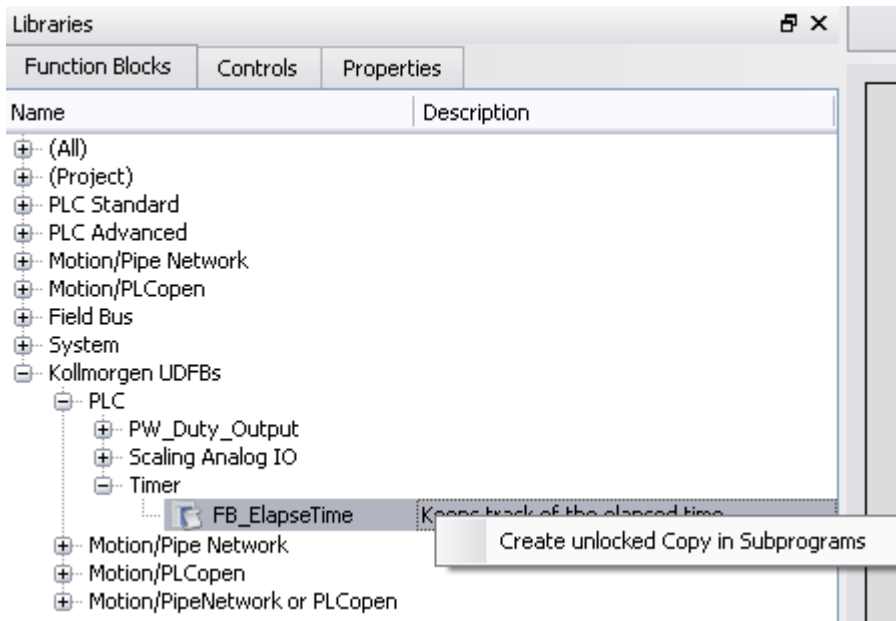

5.2 Working with Kollmorgen UDFBs

By default all Kollmorgen UDFBs are protected, meaning they may not be modified or renamed. When a Kollmorgen UDFB is dropped into an instance it is not editable. There are two solutions to make it editable:

- Right click on a Kollmorgen UDFB that has been dropped into an instance (in **Subprograms**) and select **Unlock**. This creates an unlocked version of the UDFB with the name "U<sequence number><UDFB name>".

- Instead of dropping a Kollmorgen UDFB into an instance, right click on the UDFB and select **Create unlocked copy in Subprograms**. This creates an unlocked instance of the UDFB with the name "U<sequence number><Kollmorgen UDFB name>".

Once a Kollmorgen UDFB has been unlocked it may be renamed and exported by right-clicking on the UDFB. Renamed UDFBs must have unique names. Importing a saved UDFB will increment the UDFB's name.

TIP

In order for a UDFB to modify a structure or array based on the output, you must first define it as an input. The input is automatically set as an INOUT parameter. This is because OUTs are strictly simple types.

5.2.1 FB_FirstOrderDigitalFilter

5.2.1.1 Description

This FB is defined to filter an Analog signal.

In any control system with an analog feedback signal present there is the risk of unwanted noise and jitter that can compromise the signal integrity yielding a less desirable system.

This Kollmorgen UDFB will provide a digital first order filter of an analog feedback signal from an LVDT, tension transducer, potentiometer, encoder, resolver, or some other like device. The amount of filtering is based on a gain value and can provide no filter to full filter conditioning.

The following figure shows the function block I/O

Figure 1-124: CBS First Order Digital Filter

5.2.1.2 Arguments

5.2.1.3.1 Inputs

EN	Description	Enables execution (FFLD only)
	Data type	BOOL
	Range	—
	Unit	n/a
	Default	
AnalogInput	Description	Analog Input from transducer
	Data type	INT
	Range	—
	Unit	n/a
	Default	
FilterGain	Description	Filter Gain
	Data type	REAL
	Range	[1 - 0.05]
	Unit	n/a
	Default	—

5.2.1.4.2 Outputs

OK	Description	Execution Complete
	Data type	BOOL
	Range	[0,1]
	Unit	
FilterOutput	Description	Filtered analog input value
	Data type	REAL
	Range	[0,1]
	Unit	

5.2.1.5 Usage

When using this UDFB, the Enable (EN) input should always be energized in order to provide the desired filtering.

The AnalogInput input is the unfiltered “raw” analog feedback signal from an LVDT, tension transducer, potentiometer, or some other like device.

The FilterGain defines the amount of filtering to be used. The range of the gain is from 1.0 or no filtering to 0.05 or the maximum filtering.

The FilterOutput is the filtered analog input and is typically used as an input to some other function block or UDFB that has an analog input, for example the MCFB_GearedWebTension UDFB.

The implementation of the digital first order filter is for PLCopen.

The equation is defined as: $Input * Gain + Output * (1 - Gain) = Output$

The steady state filter delay with a gain of 0.8 can be seen in the following table.

FilterGain	FilterInput	FilterOutput
0.8	0	0
	100	80
	100	96
	100	99.2
	100	99.84
	100	99.968
	100	99.9936
	100	99.99872
	100	99.999744

Table 1-9: Filter Input Delay Example

The range of the filter gain is between 1.00 and 0.05. From the table, for a filter gain of 0.8 there is a delay of 15 time constants with a time constant defined as the rate the UDFB is scanned or executed in the application. For example if the UDFB was executed every millisecond a gain of 0.8 would provide a filter delay of 15ms. Conversely a gain of 1.00 provides zero filtering and the output signal follows the input signal, and a gain of 0.05 provides the most filtering for 463 ms.

The numbers of filter delays for a steady state analog input at a given gain are shown in the table and graph below.

Gain	Filter Delay Tn
1.00	0
0.95	8
.90	11
.85	13
.80	15
.75	18
.70	20
.65	23
.60	26
.55	30
.50	35
.45	40
.40	47
.35	56
.30	66
.25	83
.20	107
.15	146
.10	226
.05	463

Of course a real world analog input is most always a varying feedback signal. In Table 2.3 this is shown with an initial input of 100, a gain of 0.8, and a random variability of 10%. Filter Input

Filter Input	Filter Current Output	Amount of Input Filtering	Random Filter % Variation
0	0	0	10%

5.2.1.10.3 Function Block Diagram

5.2.2 FB_PWDutyOutput

5.2.2.1 Description

The Pulse Width Duty Cycle function block accepts an input value between the minimum and maximum input range and converts this to a duty cycle percentage. The output is then cycled on and off over the period of the duty cycle at the duty cycle percentage. If it is desired to have the output ON time range from 0 to the duty cycle period, the minimum should be set to zero and the maximum to the duty cycle period. If the calculated duty cycle based on the input and range values is less than the minimum ON time (MinTime), the output will not come on. If the calculated duty cycle is between or equal to the range values the output is cycled by the duty cycle. If the calculated duty cycle is greater than the maximum ON time (MaxTime) the output will remain on.

The following figure shows the function block I/O

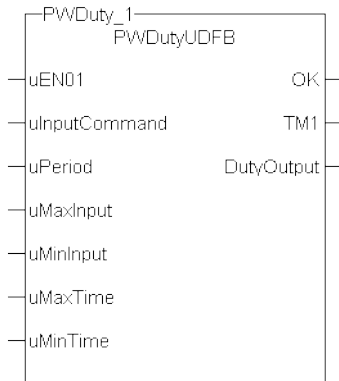

Figure 1-125: Pulse Width Duty Cycle

5.2.2.2 Arguments

5.2.2.3.1 Input

uEN01	Description	Enable for the block
	Data type	BOOL
	Range	[0 , 1]
	Unit	n/a
	Default	—
uInputCommand	Description	Duty Cycle Input (sometimes the output of a PID block).
	Data type	REAL
	Range	[0 , 1]
	Unit	n/a
	Default	—
uPeriod	Description	Period of the duty cycle
	Data type	TIME
	Range	[0 , 1]
	Unit	n/a
	Default	—
uMaxInput	Description	Maximum value for the Input
	Data type	REAL
	Range	[0 , 1]
	Unit	n/a
	Default	—

uMinInput	Description	Minimum value for the Input
	Data type	REAL
	Range	[0 , 1]
	Unit	n/a
	Default	—
uMaxTime	Description	Maximum on time for the Output
	Data type	TIME
	Range	[0 , 1]
	Unit	n/a
	Default	—
uMinTime	Description	Minimum on time for the Output
	Data type	TIME
	Range	[0 , 1]
	Unit	n/a
	Default	—

5.2.2.4.2 Output

OK	Description	Function block is OK.
	Data type	BOOL
	Unit	n/a
TM1	Description	Duty cycle on time
	Data type	TIME
	Unit	n/a
DutyOutput	Description	Indicates if output is on or off
	Data type	BOOL
	Unit	n/a

5.2.2.5 Usage

5.2.2.10.3 Function Block Diagram

5.2.2.11 FB_ScaleInput

5.2.2.12.1 Description

Scale DINT to LREAL.

Converts un-scaled DINT values from Analog Inputs into user units of type LREAL. The input signal is converted based on a linear mapping automatically calculated by two points entered. InputMin is mapped to OutputMin, InputMax is mapped to OutputMax, and all values in between are scaled automatically. If an input value is not between the selected Min/Max, the Boolean output OutsideRange turns TRUE, and the OutputSignal is set to the corresponding OutputMin or OutputMax value.

The following figure shows the function block I/O:

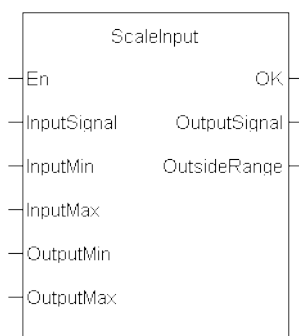

Figure 1-126: Scale Input

5.2.2.13.2 Arguments

5.2.2.14.3.1 Input

InputSignal	Description	Un-scaled input signal
	Data type	DINT

5.2.2.21.10.3 Function Block Diagram

5.2.2.22 FB_ScaleOutput

5.2.2.23.1 Description

Scale LREAL to DINT .

This Kollmorgen UDFB converts un-scaled LREAL values from a PLC Program into units of type DINT that can be mapped to an analog output. The input signal is converted based on a linear mapping automatically calculated by two points entered. InputMin is mapped to OutputMin, InputMax is mapped to OutputMax, and all

values in between are scaled automatically. If an input value is not between the selected Min/Max, the Boolean output OutsideRange turns TRUE, and the OutputSignal is set to the corresponding OutputMin or OutputMax value.

The following figure shows the function block I/O:

Figure 1-127: Scale Output

5.2.2.24.2 Arguments

5.2.2.25.3.1 Input

5.2.2.32.10.3 Function Block Diagram

5.2.3 FB_ElapseTime

5.2.3.1 Description

This Kollmorgen UDFB keeps track of the time (oTotalOnTime) that a Boolean input variable is on. Once the iEN00 enable input is high the Kollmorgen UDFB will keep track of the total time iVariable is on. If iVariable changes to an off state while iEN00 is on, the oTotalOnTime will stop. oTotalOnTime will start to add again once iVariable changes state to high. As long as the iEN00 input is on, iVariable can change states many times. The oTotalOnTime will reflect only the total time that iVariable has been on. While iVariable is still TRUE, oInProcess will also be TRUE and oDone will be FALSE. Once iVariable is FALSE, oInProcess will be FALSE and oDone will be TRUE.

If the iEN00 input goes off, oTotalOnTime stops counting and the Kollmorgen UDFB execution stops. To restart the timer turn iEN00 on again. This will reset oTotalOnTime to zero and counting will begin once iVariable is also on.

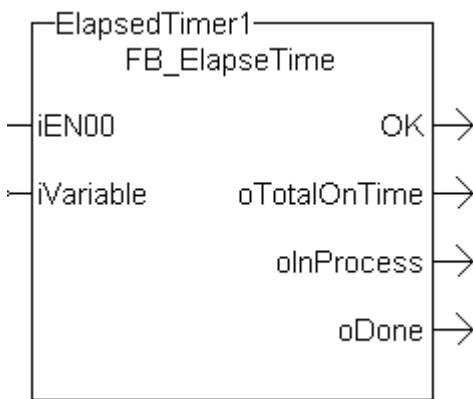

Figure 1-128: FB_ElapseTime

Figure 1-129: MFB_ElapseTime – Time Diagram

5.2.3.2 Arguments

5.2.3.3.1 Input

iEN00	Description	Enable for the block
	Data type	Boolean
	Range	FALSE or TRUE
	Unit	n/a
	Default	FALSE
iVariable	Description	The variable to be tracked
	Data type	Boolean
	Range	FALSE or TRUE
	Unit	n/a
	Default	FALSE

5.2.3.4.2 Output

OK	Description	Function Block OK. This output follows the state on iEN00 input
	Data type	Boolean
	Range	FALSE or TRUE
	Unit	n/a
oTotalOnTime	Description	The amount of time the iVariable is turned on.
	Data type	Time
	Range	0ms – 24h
	Unit	ms
oTotalOnTime	Description	The amount of time the iVariable is turned on.
	Data type	Time
	Range	0ms – 24h
	Unit	ms
oInProcess	Description	The state of block's execution whether or not it is still keeping track of time
	Data type	Boolean
	Range	FALSE or TRUE
	Unit	n/a
oDone	Description	The state of block's execution whether or not it is completed
	Data type	Boolean
	Range	FALSE or TRUE
	Unit	n/a

5.2.3.5 Usage

- Enable the block by setting iEN00 to TRUE
- Either manually set iVariable to TRUE or have the application set this variable to TRUE
- Once oDone returns TRUE, read the oTotalOnTime to find out how long iVariable was on.

5.2.3.6 Example

5.2.3.7.1 Structured text

```

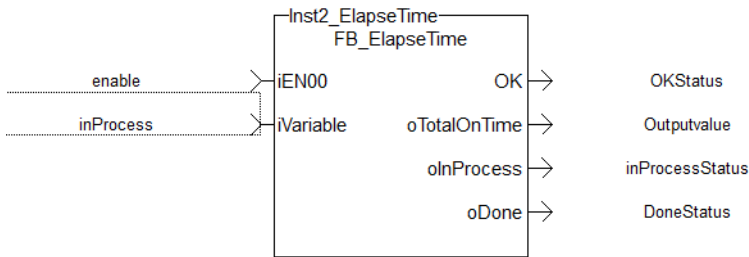

Inst_FB_ElapseTime1( TRUE, InProcess );

IF Inst_FB_ElapseTime1.oDone THEN
Outputvalue := Inst_FB_ElapseTime1.oTotalOnTime;
END_IF;
    
```

5.2.3.8.2 Function Block Diagram

5.2.3.9.3 Free Form Ladder Diagram

5.2.4 PipeNetwork_FFLD

5.2.4.1 Description

This function is used to call the PNCode Function Block in FFLD POU's. It starts and initializes the Pipe Network, based on the command specified by cmdID. Internally this function calls the Function Block PNCode.

This is a special function that should only be used in Pipe Network applications that contain FFLD POU's that call PNCode. Calling this function instead of PNCode in FFLD POU's will eliminate the following compile error that occurs after modifying the Pipe Network using the Pipe Network editor.

Controller:PLC:Main: NW1(1,14): PNCode: Invalid block height

NOTE

The compile error is generated because the number of outputs on PNCode can vary. This occurs after modifying the original Pipe Network using the Pipe Network editor. The new PNCode Function Block is not automatically updated in any FFLD POU, reflecting the new outputs. You need to manually update each PNCode Function Block call in any FFLD POU to correct this problem.

Figure 1-130: PipeNetwork_FFLD

See also: Design Motion with Pipe Network, Initialize and Start up a Pipe Network, PLCopen 2-Axes Template with FFLD

5.2.4.2 Arguments

5.2.4.3.1 Inputs

En	Description	Request to initialize the Pipe Network
	Data type	BOOL
	Range	0, 1
	Unit	n/a
	Default	—

cmdID	Description	Commands used to start and initialize the Pipe Network <ul style="list-style-type: none"> • MLPN_CREATE_OBJECTS – Create Pipe Network • MLPN_POWER_ON – Power on all axes • MLPN_POWER_OFF – Power off all axes • MLPN_ACTIVATE – Activate the pipes • MLPN_CONNECT – Connect the axes to the pipes • MLPN_DEACTIVATE – Deactivate the pipes
	Data type	DINT
	Range	n/a
	Unit	n/a
	Default	—

5.2.4.4.2 Outputs

OK	Description	Returns TRUE when the function has completed
	Data type	BOOL
	Unit	n/a

5.2.4.5 Usage

- This is a special function that should only be used in Pipe Network applications that contain FFLD POU's that call PNCode.
- To use this Function, PipeNetwork must be declared as a global variable in the dictionary.

TIP

The Pipe Network FFLD Application Template is a good example of how to use this Function. See Pipe Network 2-Axes Template with FFLD only.

5.2.4.6 Example

5.2.4.7.1 FFLD

5.2.5 ProfilesCode_FFLD

5.2.5.1 Description

This function is used to call the Profiles Code Function Block in FFLD POU's. Internally this function calls the Function Block ProfilesCode.

This is a special function which should only be used in applications that contain FFLD POU's that call ProfilesCode. Calling this function instead of ProfilesCode in FFLD POU's will eliminate the following compile error that occurs after adding a new Profile to the project tree.

```
Controller:PLC:Main:NW1(1,14):ProfilesCode:Invalid block height
```

The compile error is generated because the number of outputs on ProfilesCode can vary. This occurs after adding a new profile to the project tree. The ProfilesCode Function Block is not automatically updated in any FFLD POU, reflecting the new outputs. You needed to manually update each ProfilesCode Function Block

call in any FFLD POU to correct this problem. If you use this new Function instead, you no longer need to manually update each ProfilesCode Function Block in FFLD.

Figure 1-131: ProfilesCode_FFLD

5.2.5.2 Arguments

5.2.5.3.1 Inputs

En	Description	Request to initialize the Pipe Network
	Data type	BOOL
	Range	0,1
	Unit	n/a
	Default	—
cmdID	Description	Commands used to start and initialize the Pipe Network
		<ul style="list-style-type: none"> • MLPR_CREATE_PROFILES - Creation and initialization of profiles.
	Data type	DINT
	Range	n/a
	Unit	n/a
	Default	—

5.2.5.4.2 Outputs

OK	Description	Returns TRUE when the function has completed
	Data type	BOOL
	Unit	n/a

5.2.5.5 Usage

- This is a special function that should only be used in applications that contain FFLD POUs that call ProfilesCode.
- To use this function, Profiles must be declared as a global variable in the dictionary.

TIP

The Pipe Network and PLCopen 2 Axis FFLD Application Templates are two examples of how to use this function. See Pipe Network 2-Axes Template with FFLD only and PLCopen 2-Axes Template with FFLD.

5.2.5.6 Example

5.2.5.7.1 FFLD

5.2.6 FB_TemperaturePID

5.2.6.1 Description

This function block provides PID temperature control with auto tuning.

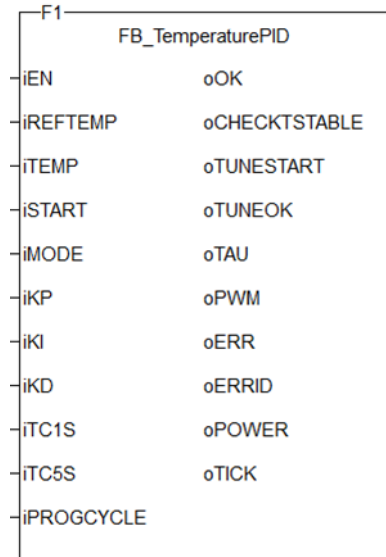

Figure 1-132: The TemperaturePID user-defined function block

5.2.6.2 Arguments

5.2.6.3.1 Inputs

iEN	BOOL	Enable function
iREFTEMP	LREAL	Reference temperature [°C]
iTEMP	LREAL	Actual temperature [°C]
iSTART	BOOL	Start PID or auto tuning
iMODE	BOOL	FALSE-automatic, TRUE-tuning
iKP	LREAL	PID Proportional Gain
iKI	LREAL	PID Integral Gain
iKD	LREAL	PID Derivative Gain
iTC1S	BOOL	Sampling Time is 1s
iTC5S	BOOL	Sampling Time is 5s
iPROGCYCLE	LREAL	Execution time of the function [ms]

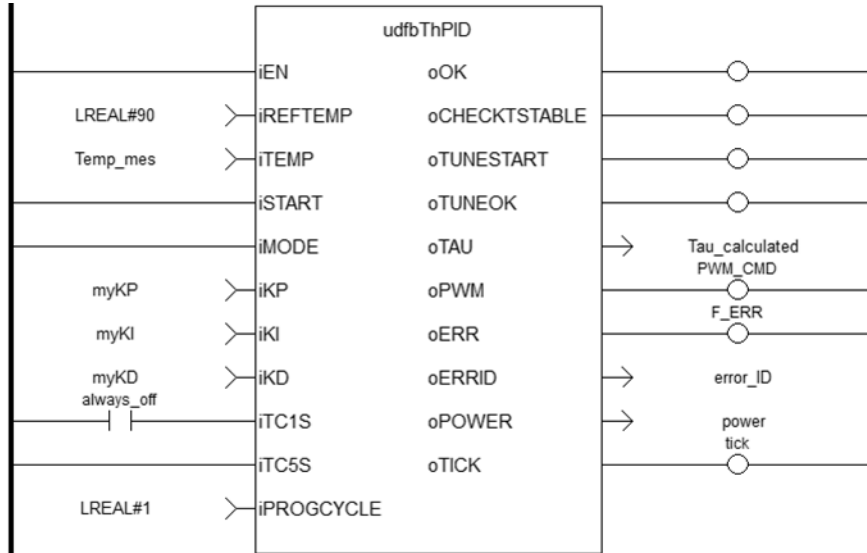

5.2.6.4.2 Outputs

oOK	BOOL	Function enabled
oCHECKSTABLE	BOOL	TRUE when checking if ambient temperature is stable
oTUNESTART	BOOL	Tuning is started
oTUNEOK	BOOL	Tuning is completed
oTAU	LREAL	System Time Constant[s]
oPWM	BOOL	PWM command for heater
oERR	BOOL	Function error
oERRID	INT	Function ID error (in case of oERR=TRUE)

oPOWER **LREAL** % of power requested from heater (100%=full power)
oTICK **BOOL** Pulse every sampling time

5.2.6.5 Usage

5.2.6.6.1 Tuning Process

Tuning consists of three steps.

1. Check if the ambient temperature is stable: the measured **delta_temp=Tmax-Tmin** must be lower than **0.1*Tmax**.
 This step takes 10 cycles ($10 * iTC5s$ or $10 * iTC1s$).
 The tuning fails ($oERR=TRUE$, $oERRID=1$) if the ambient temperature is greater than **0.1*Tmax**, otherwise **Tamb=(Tmax+Tmin)/2**.
2. Start tuning Phase1: output **oPWM** is kept TRUE until the final measured temperature **iTEMP** gets over **iREFTEMP/2**. After that **oPWM** is kept LOW.
3. Start tuning Phase2: with **oPWM** kept LOW the temperature gets down until the final value is lower than $[(iREFTEMP/2 - Tamb) * 0.368 + Tamb]$.

After, PID gains are calculated as:

```

Kp=10
Ki=0.14
delta_time = time to complete Phase2

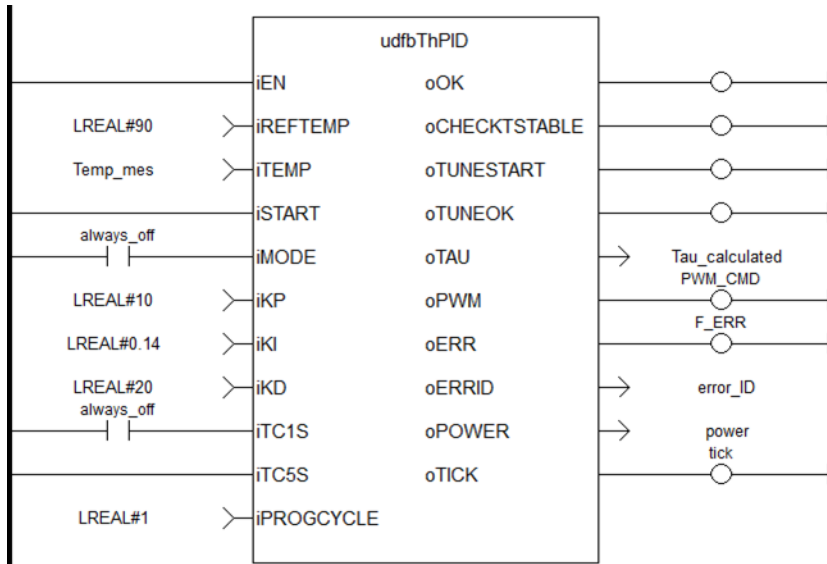

Kd=SQRT(delta_time)*7
```

The tuning is completed.

TIP

oTAU may be useful for setting the proper sampling time (1s or 5s).

5.2.6.7.2 Start PID Controller

Upon starting the PID controller, the output **oPWM** is modulated 5 times within the sampling time (blue line is **oTICK**, green line is **oPWM**) and each pulse length depends on output **oPOWER** (100%=full length).

5.2.6.8 MLFB_HomeFindHomeInput

5.2.6.9.1 Description

The motor starts to move according to the direction setting. The home position has been found as soon as the home-switch becomes active during a motion in direction of the direction setting. The command position of the drive will immediately be set to the position value and the motor ramps down to velocity 0. The hardware limit switches are monitored during the homing procedure. The drive behaves as follows in case that a hardware limit switch is active before the home-switch has been activated: The motor changes the direction until the home switch is crossed. The motor ramps down to zero velocity and reverses direction again after crossing the home-switch. The home-switch will now be activated according to the direction setting and the home-position has been found. The command position of the drive will immediately be set to the position value and the motor ramps down to zero velocity.

5.2.6.10.2 Arguments

4	SDO Read/Write Error		
5	Input Parameter out of Range		
	Data type	DINT	
	Unit	n/a	

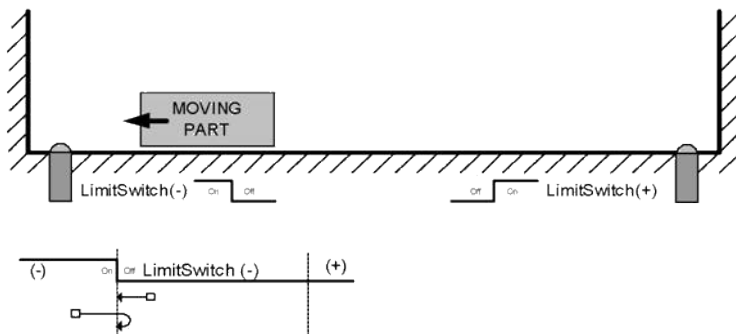

5.2.6.69.5 Usage

This homing procedure performs a homing function searching for sensor using only High Speed Input Switches. (A High Speed Limit Switch has 1 “Off” (or “On”) area).

- Home is commanded by user in the desired homing direction at the selected Velocity
- If LimitSwitch is found ‘On’ on rising ‘Execute’, then the process is started in the opposite direction as specified, LimitSwitch is search for ‘Off’ (or On, depending on LimitSwitchMode setting) Edge (released), and process is restarted again in original direction. This ensures that the end conditions are

always the same

- The Timeout can cause an error if exceeded

5.2.6.85.10.3 Function Block Diagram

5.2.6.86 MLFB_HomeFindLimitFastInput

5.2.6.87.1 Description

This function block performs a single-axis home to a limit switch connected to a High Speed Input. The motor starts to move according to the direction setting. The home position has been found as soon as the fast input selected is triggered on the edge selected.

An absolute move is made to the triggered position, and then the position value is set.

The following figure shows the function block I/O:

Figure 1-135: MLFB HomeFindLimitFastInput

5.2.6.88.2 Arguments

5.2.6.89.3.1 Input

ibExecute	Description	Request the homing step procedure at rising edge						
	Data type	BOOL						
	Range	[0 , 1]						
	Unit	n/a						
	Default	—

5	Input Parameter out of Range														
Data type	DINT														
Unit	n/a														

5.2.6.91.5 Usage

This homing procedure performs a homing function searching for sensor using only High Speed Input Switches. (A High Speed Limit Switch has 1 "Off" (or "On") area).

- Home is commanded by user in the desired homing direction at the selected Velocity.
- The Timeout can cause an error if exceeded

5.2.6.107.10.3 Function Block Diagram

5.2.7 Jog for Pipe Network

5.2.7.1 Description

This function is defined to jog an axis in the selected direction at a defined speed. The En input (FFLD editor only) must be high. Typically wired to the rail. The AxisID selects the axis to jog. The JogPlus and JogMinus inputs select the direction the motion will occur in. Only one of these inputs should be enabled at a given time. If both are selected the motion will stop. If other motion is active when the jog is requested that motion will be aborted and the jog will start.

The following figure shows the function I/O

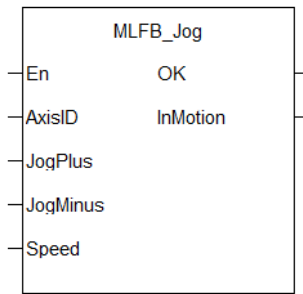

Figure 1-137: Kollmorgen UDFB Jog for PipeNetwork

5.2.7.2 Arguments

5.2.7.3.1 Input

En	Description	Enables execution (FFLD only)
	Data type	BOOL
	Range	—
	Unit	n/a

	Data type	BOOL
	Range	[0 , 1]
	Unit	n/a
JogMinus	Description	Enables a Jog in the Minus direction
	Data type	BOOL
	Range	[0 , 1]
	Unit	n/a
Speed	Description	Rate at which the axis will move
	Data type	LREAL
	Range	—
	Unit	User unit/sec
	Default	—

5.2.7.4.2 Output

InMotion	Description	Jogging is active when TRUE
	Data type	BOOL
	Range	n/a

5.2.7.5 Usage

This function is used to command motion in a designated direction at a defined rate. This may be used where continuous motion required as in a conveyor system, or in a setup mode for manually jogging the axis. Motion will start when the JogPlus or JogMinus input is true. It will stop when the input goes false. This function is used with the Pipe Network motion engine.

5.2.7.51.5 Usage

This physical layout has the risk that homing is started in the wrong direction (escaping the switch). To support such case, it implements a special behavior when Limit Switches are found (or the AbsSwitch itself is "On" at Execute):

- The homing is commanded in the most likely direction were the sensor can be found. In this example (-).
- The velocity is defined by the input.
- The torque is limited.
- Both Time and Distance Limits can cause an error if exceeded
- If any LimitSwitch is found during Homing (any of them), then a special process is started in the opposite direction, the AbsSwitch is searched to switch off (or On, depending on SwitchMode setting). The Edge (passed by), and homing process is restarted in the original direction and with the same conditions. This ensures that the end conditions are always same
- If the SwitchMode is either MC_SwitchNegative or MC_SwitchPositive, then the special process is also started in opposite direction depending from the switch state at 'execute'.
- The direction changes only when the specified Velocity is reached (InVelocity).
- This Function Block doesn't modify the actual position

An overlapping switch configuration is also possible. This has same the behavior as working on the limit switches:

If the input Direction is set to a fixed direction (MC_Positive or MC_Negative), then the initial switch state is ignored (used for example in rotary axis where only one sense of rotation is allowed):

5.2.7.73.5 Usage

This homing procedure performs a homing function searching for sensor using only LimitSwitches. (A LimitSwitch has 1 "Off" (or "On") area).

- Home is commanded by user in the desired homing direction at the selected Velocity.
- If LimitSwitch is found 'On' on rising 'Execute', then the process is started in the opposite direction as specified, LimitSwitch is search for 'Off' (or On, depending on LimitSwitchMode setting) Edge (released), and process is restarted again in original direction. This ensures that the end conditions are always the same.
- The torque is limited.
- The Time and Distance Limits can cause error if exceeded
- The Direction changes only when the specified Velocity is reached, this ensures acceleration and deceleration spaces are fixed
- This Function Block doesn't modify actual position

5.2.7.84.5 Usage

This function Block performs homing by searching for Zero pulse (also called Marker or reference pulse) in encoder. The reference pulse appears once per encoder revolution.

- Home is commanded by user in the desired homing direction at the programmed velocity.
- First occurrence of the Reference Pulse, Homing is finished
- Torque is limited. Time and Distance Limits can cause error if exceeded
- This Function modifies actual position and sets to the "SetPosition" input value at the end

It is common that a first approach is performed against a mechanical sensor at higher velocity, and after a Reference Pulse, at a lower velocity. This is a traditional 2-Step homing (Coarse by external Switch in reverse and Fine by Reference Pulse in forward).

5.2.7.94.4 Usage

- The homing is commanded in the most likely direction were the sensor can be found. In this example (-).
- If any LimitSwitch is found during Homing (any of them), then a special process is started in the opposite direction, the AbsSwitch is searched to switch off (or On, depending on SwitchMode setting). The Edge (passed by), and homing process is restarted in the original direction and with the same conditions. This ensures that the end conditions are always same.

5.2.7.99 MCFB_StepLimitSwitchFastInput

5.2.7.100.1 Description

This function block performs a homing function by searching for an external physical switch. The switch must be connected to one of the two fast inputs on the Axis' AKD drive. The Axis will move and when a fast input is triggered, the triggered axis will then perform an absolute move to the latched position.

The following figure shows the function block I/O:

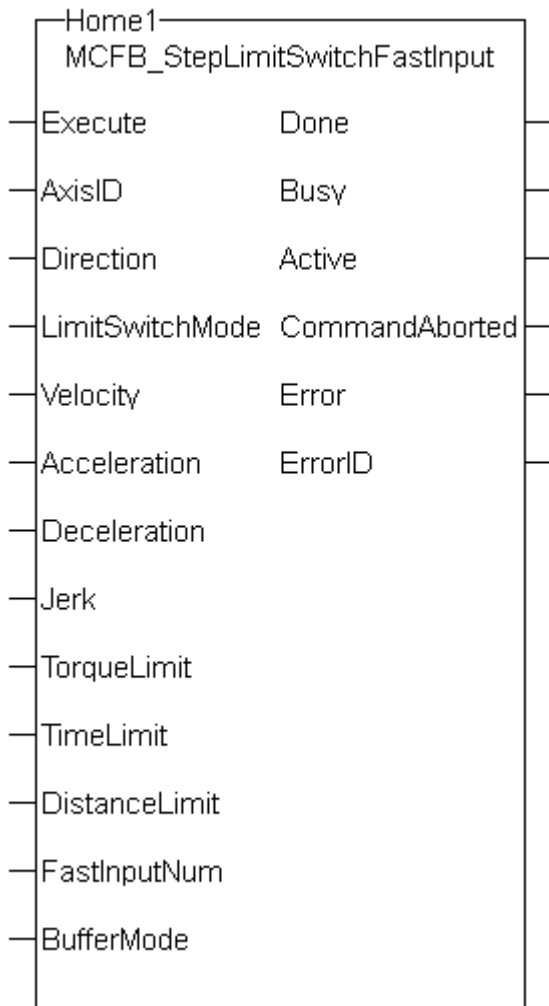

Figure 1-144: MCFB StepLimitSwitchFastInput

5.2.8 Jog for PLCopen

5.2.8.1 Description

This function block is defined to jog an axis in the selected direction at a defined speed. The En input (FFLD editor only) must be high. Typically wired to the rail.

The AxisID selects the axis to jog. The JogPlus and JogMinus inputs select the direction the motion will occur in. Only one of these inputs should be enabled at a given time. If both are selected the motion will stop. If other motion is active when the jog is requested that motion will be aborted and the jog will start.

The following figure shows the function block I/O

Figure 1-145: Jog for PLCopen

5.2.8.10.3 Function Block Diagram

5.2.9 MCFB_GearedWebTension

This Kollmorgen UDFB facilitates dancer and tension control in an electronic geared master/slave machine design. This is done by using the analog feedback from a LVDT, tension transducer, potentiometer, encoder, resolver or some other similar device. The analog feedback value is compared to a pre-determined analog set-point. The difference or error is used in a PID algorithm with the summed output driving changes to the master/slave gearing relationship. This results in the slave axis either speeding up or slowing down to maintain desired tension.

The following figure shows the function block I/O.

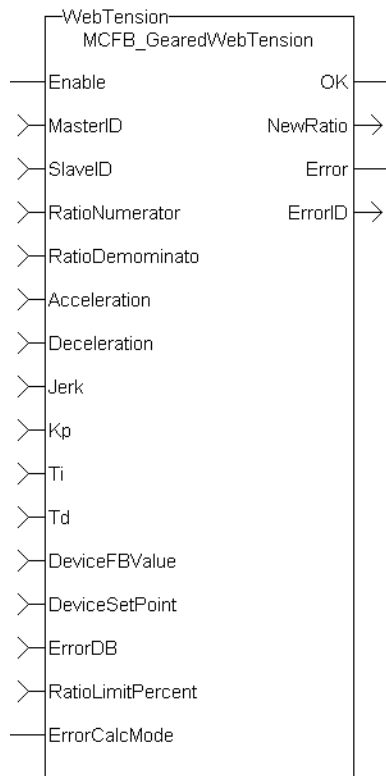

Figure 1-146: MCFB_GearedWebTension Function Block I/O

5.2.9.3.2 Output

OK	Description The output will have power flow after the enable input has been energized.
	Data Type BOOL
	Range [0,1]
	Unit n/a
NewRatio	Description New master/slave ratio
	Data Type REAL
	Range [-3.4E38 to 3.4E38 and -3.4E-38 to 3.4E-38 (6 to 7 significant digits of accuracy)]
	Unit n/a
Error	Description Function block error
	Data Type BOOL
	Range [0,1]
	Unit n/a
ErrorID	Description Function block error value
	Data Type INT
	Range [-32768 to +32767]
	Unit n/a

5.2.9.4 Usage

This Kollmorgen UDFB is used in conjunction with the main ladder MC_GearIn function and it is assumed that the master/slave move is active. Internal to the Kollmorgen UDFB is another call to the MC_GearIn function therefore the MasterID, SlaveID, RatioNumerator, RatioDenominator, Acceleration, Deceleration, and Jerk inputs are the same values as the main ladder MC_GearIn function input values, both with the Buffer input of 0. This assures that the initial starting master/slave ratio will transition to the new Kollmorgen UDFB ratio smoothly.

This Kollmorgen UDFB will change the master/slave ratio that was defined by the MC_GearIn function based on the error between the analog input and the analog set-point. The magnitude of the ratio and the rate of the ratio change is defined by the Kp, Ti, Td PID gain values. The new ratio calculated is output at the NewRatio output.

The RatioLimitPercent input is the maximum and minimum theoretical new ratio that can be changed. This provides a +/- window limit around the running ratio to prevent unwanted motion in the event of a web break or analog feedback failure.

5.2.9.5.1 Example 1

NOTE

This example assumes that the analog feedback device is located *after* (or downstream in the process) the feedroll axis.

RatioNumerator = 1

RatioDemominator = 2 Therefore the master/slave starting ratio is 0.5000000

ErrorCaclMode = 0

DeviceFBValue = 6

DeviceSetPoint = 4 Therefore error $6 - 4 = 2$

Kp = 0.005

Ti = 0

Td = 0

From the equation:

New RatioDemominator = (RatioDemoninator - Kp * error)

Therefore the new RatioDenominator = $(2 - 0.005 * 2) = 1.99$

Thus the new master/slave running ratio is $1 / 1.99 = 0.502512562$

Since the master/slave ratio is greater than the previous ratio the slave axis is going faster and the tension is reduced.

5.2.9.6.2 Example 2

NOTE

This example assumes that the analog feedback device is located *before* (or upstream in the process) the feedroll axis.

This is the same example as example 1 with the exception of the ErrorCaclMode input Boolean set.

RatioNumerator = 1

RatioDemominator = 2 Therefore the master/slave starting ratio is 0.5000000

ErrorCaclMode = 1

DeviceFBValue = 6

DeviceSetPoint = 4 Therefore error is $4 - 6 = -2$

Kp = 0.005

Ti = 0

Td = 0

From the equation:

New RatioDemominator = (RatioDemoninator - (Kp * error))

Therefore the new RatioDenominator = $(2 + 0.005 \cdot 2) = 2.01$

Thus the new master/slave running ratio is $1 / 2.01 = 0.497512437$

Since the master/slave ratio is less than the previous ratio the slave axis is going slower and the tension is reduced.

5.2.9.7.3 PID Function in KAS:

There is a PID function in KAS that could be used for the PID control section in the Kollmorgen UDFB.

5.2.9.8.4 Programming tips:

The First Order Digital Filter Kollmorgen UDFB can be used to decrease excess dither on the analog input. The filtered analog value is then used at the DeviceFBValue input of the MCFB_GearedWebTension Kollmorgen UDFB .

The assumption is a MC_GearIn function block is first called in the main ladder and these initial values are then used at the inputs for the Kollmorgen UDFB. The resolution of the initial MC_GearIn the RatioNumerator and RatioDenominator inputs are directly related to the resolution of the calculated master/slave ratio (from the Kollmorgen UDFB inputs) and may need to be scaled accordingly.

5.2.9.9.5.1 Example 1

No scaling

Initial MC_GearIn input RatioNumerator = 2

Initial MC_GearIn input RatioDenominator = 1 then initial Master/Slave ratio = 2

Kollmorgen UDFB input RatioNumerator = 2

Kollmorgen UDFB input RatioDenominator = 1 then Kollmorgen UDFB Master/Slave ratio = 2

Kollmorgen UDFB input DeviceFBValue = 4

Kollmorgen UDFB input DeviceFBSetpoint = 3 then Device PID error = 1 assume $K_P = 1$, T_i and $T_d = 0$

New Kollmorgen UDFB RatioNumerator = Current RatioNumerator – PID error = $2 - 1 = 1$ then new Kollmorgen UDFB Master/Slave ratio = 1

Resolution = Master/Slave ratio:PID Error ratio = 1:1

The resolution is so coarse that a change of 1 for the error output of the PID creates a Master/Slave ratio change of 1. This results in a significant change to the slave velocity that will probably cause excess slack or web breakage.

5.2.9.10.6.2 Example 2

Scaling value = 1000

Initial MC_GearIn input RatioNumerator = 2

Initial MC_GearIn input RatioDenominator = 1 then initial Master/Slave ratio = 2

Kollmorgen UDFB input RatioNumerator = 2000

Kollmorgen UDFB input RatioDenominator = 1000 then Kollmorgen UDFB Master/Slave ratio = 2

Kollmorgen UDFB input DeviceFBValue = 4

Kollmorgen UDFB input DeviceFBSetpoint = 3 then Device PID error = 1 assume $K_P = 1$, T_i and $T_d = 0$

New Kollmorgen UDFB RatioNumerator = Current RatioNumerator – PID error = $2000 - 1 = 1999$ then new Kollmorgen UDFB Master/Slave ratio = 1999

Resolution = Master/Slave ratio:PID Error ratio = 2000:1

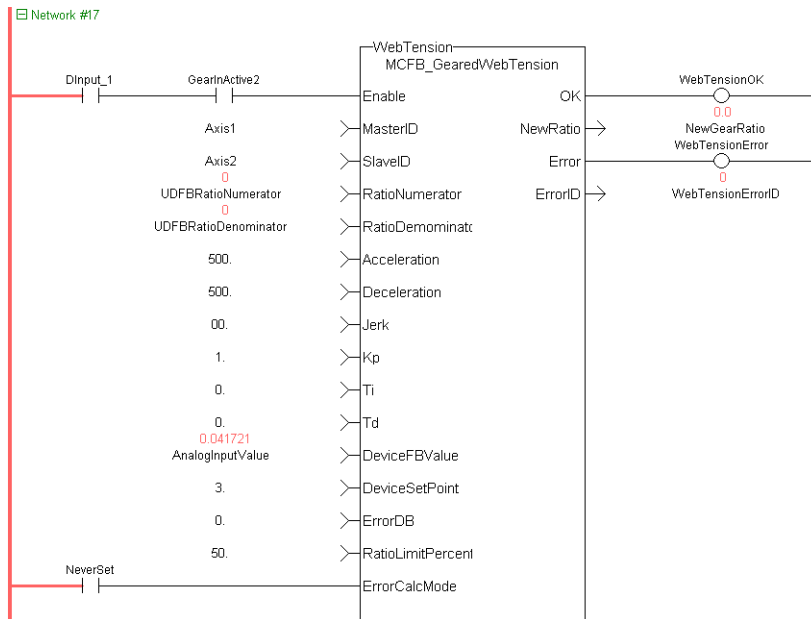

This resolution is much finer than example 1 so for a change of 1 for the error output of the PID this creates a Master/Slave ratio change of 1999. This results in a slower rate of change to the slave velocity that is more suited to good tension in a machine process.

5.2.10 FB_FirstOrderDigitalFilter

5.2.10.1 Description

This FB is defined to filter an Analog signal.

In any control system with an analog feedback signal present there is the risk of unwanted noise and jitter that can compromise the signal integrity yielding a less desirable system.

This Kollmorgen UDFB will provide a digital first order filter of an analog feedback signal from an LVDT, tension transducer, potentiometer, encoder, resolver, or some other like device. The amount of filtering is based on a gain value and can provide no filter to full filter conditioning.

The following figure shows the function block I/O

Figure 1-147: CBS First Order Digital Filter

5.2.10.2 Arguments

5.2.10.3.1 Inputs

EN	Description	Enables execution (FFLD only)
	Data type	BOOL
	Range	—
	Unit	n/a
	Default	
AnalogInput	Description	Analog Input from transducer
	Data type	INT
	Range	—
	Unit	n/a
	Default	
FilterGain	Description	Filter Gain
	Data type	REAL
	Range	[1 - 0.05]
	Unit	n/a
	Default	—

5.2.10.4.2 Outputs

OK	Description	Execution Complete
	Data type	BOOL
	Range	[0,1]
	Unit	
FilterOutput	Description	Filtered analog input value
	Data type	REAL
	Range	[0,1]
	Unit	

5.2.10.5 Usage

When using this UDFB, the Enable (EN) input should always be energized in order to provide the desired filtering.

The AnalogInput input is the unfiltered “raw” analog feedback signal from an LVDT, tension transducer, potentiometer, or some other like device.

The FilterGain defines the amount of filtering to be used. The range of the gain is from 1.0 or no filtering to 0.05 or the maximum filtering.

The FilterOutput is the filtered analog input and is typically used as an input to some other function block or UDFB that has an analog input, for example the MCFB_GearedWebTension UDFB.

The implementation of the digital first order filter is for PLCopen.

The equation is defined as: $Input * Gain + Output * (1 - Gain) = Output$

The steady state filter delay with a gain of 0.8 can be seen in the following table.

FilterGain	FilterInput	FilterOutput
0.8	0	0
	100	80
	100	96
	100	99.2
	100	99.84
	100	99.968
	100	99.9936
	100	99.99872
	100	99.999744
	100	99.9999488
	100	99.99998976
	100	99.99999795
	100	99.99999959
	100	99.99999992
	100	99.99999998
	100	100
	100	100
	100	100
	100	100
	100	100
	100	100
	100	100
	100	100
	100	100

Table 1-11: Filter Input Delay Example

The range of the filter gain is between 1.00 and 0.05. From the table, for a filter gain of 0.8 there is a delay of 15 time constants with a time constant defined as the rate the UDFB is scanned or executed in the application. For example if the UDFB was executed every millisecond a gain of 0.8 would provide a filter delay of 15ms. Conversely a gain of 1.00 provides zero filtering and the output signal follows the input signal, and a gain of 0.05 provides the most filtering for 463 ms.

The numbers of filter delays for a steady state analog input at a given gain are shown in the table and graph below.

Gain	Filter Delay Tn
1.00	0
0.95	8
.90	11
.85	13
.80	15
.75	18
.70	20
.65	23
.60	26
.55	30
.50	35
.45	40
.40	47
.35	56
.30	66
.25	83
.20	107
.15	146
.10	226
.05	463

Of course a real world analog input is most always a varying feedback signal. In Table 2.3 this is shown with an initial input of 100, a gain of 0.8, and a random variability of 10%. Filter Input

Filter Input	Filter Current Output	Amount of Input Filtering	Random Filter % Variation
0	0	0	10%

5.2.10.10.3 Function Block Diagram

5.2.11 MCFB_AKDFault

5.2.11.1 Description

Outputs AKD drive fault Information. The FAULT output turns TRUE when the selected drive goes into a fault state. The fault number is the same number as reported on the display of the AKD drive. This function can be used with the PLCopen Motion engines. The following figure shows the function block I/O:

Figure 1-148: MCFB_AKDFault

5.2.11.2 Arguments

5.2.11.3.1 Input

EN	Description	ENABLES the Kollmorgen UDFB (used in FFLD editor only)
	Data type	BOOL
	Range	[0 , 1]
	Unit	n/a
	Default	—
Axis	Description	Name of a declared instance of the AXIS_REF library function. For more details, About Axis Name and Number.
	Data type	AXIS_REF
	Range	[1, 256]
	Unit	n/a
	Default	—

5.2.11.4.2 Output

FAULT	Description	TRUE if selected drive currently has a Fault
	Data type	BOOL
	Range	[0 , 1]
	Unit	n/a
FaultNumber	Description	Three digit AKD Fault identifier
	Data type	DINT
	Range	[100 , 999]
	Unit	n/a

5.2.11.5 Usage

Typical usage for this UDFB are:

- Provide drive fault information that the application program uses to determine next steps such as perform a machine controlled stop or perform an immediate disable of the servo drives.
- In the application program send output fault information from this UDFB to the HMI for review by the machine operator.

5.2.12.9.2 Ladder Diagram

5.2.12.10.3 Function Block Diagram

5.2.13 FB_Cylinder

5.2.13.1 Description

This function block can be used to control a cylinder and the Limit Switches.

There are two inputs InA and InB to set the direction of the movement and the belonging LimSwitches LsA and LsB.

If InA is set to TRUE the output DirA is set to TRUE and after a time value defined by CtrlTime the LsA has to become TRUE otherwise a fault FaultLsA appears. Just as in direction B.

If both LsA and LsB are TRUE then a Fault depending of the output is set. If both InA and InB are given (e.g. to stop the cylinder movement) no limit switch is controlled.

All faults can be reset by input iResetFault.

5.2.13.2 Arguments

5.2.13.3.1 Input

iInA	Description	Set direction A
	Data type	BOOL
iInB	Description	Set direction B
	Data type	BOOL
iLsA	Description	Limit Switch at End of direction A
	Data type	BOOL
iLsB	Description	Limit Switch at End of direction B
	Data type	BOOL
iCtrlTime	Description	Max Time till Lim.Sw. has to be reached
	Data type	TIME
iResetFault	Description	Reset Fault (Is set to FALSE by UDFB!)
	Data type	BOOL

5.2.13.4.2 Output

oDirA	Description	Direction A
	Data type	BOOL
oDirB	Description	Direction B
	Data type	BOOL

oFaultLsA	Description	Fault of Lim.Sw. at End direction A
	Data type	BOOL
oFaultLsB	Description	Fault of Lim.Sw. at End direction B
	Data type	BOOL

5.2.13.5 Usage

The signal flow is valid for both directions (A and B)

If oDirA AND oDirB are active there is no Fault Control.

The Fault can be reset by iRestFault = True.

5.2.13.6 Example

5.2.13.7.1 Function Block Diagram

5.2.13.8 FB_AKDFItRpt

5.2.13.9.1 Description

Outputs AKD drive fault Information.

The oFAULT output turns TRUE when the selected drive goes into a fault state. This function block outputs the total number of faults in the AKD drive fault history variable (Pre-Defined Error Field Object 1003h), and the fault number and message for the last 3 drive faults.

Each fault has two outputs: the fault number and a fault message. The fault number is the same number as reported on the display of the AKD drive. The fault message provides a short description of the fault. For example if the first fault is a feedback error with a F401 displayed on the front of the drive, the output of this FB are:

- **oFirstFaultNumber** = 401
- **oFirstFaultMessage** = Failed To Set Feedback Type

The **iResetfaultHistory** Input resets the faults reported by the FB.

The **oDriveNotUsed** outputs a 1 (True) if the axis is configured to Simulated in the ProjectEthercat setup screen.

This function Block can be used with either the PipeNetwork or PLCopen Motion engines. The following figure shows the function block I/O:

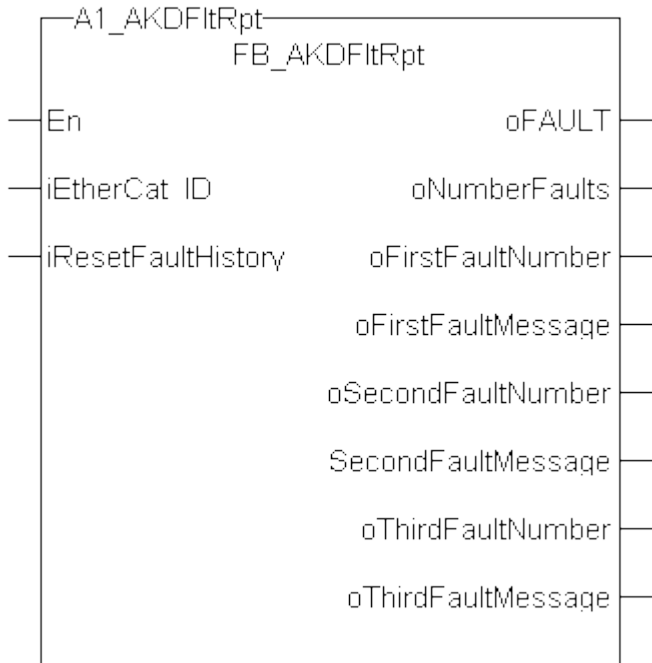

Figure 1-150: AKDFltRpt

5.2.13.29.10.3 Function Block Diagram

5.2.13.30 FB_AxisPlsPosModulo

5.2.13.31.1 Description

This function block can be used for any position of a modulo axis in both directions. The Boolean output **oPLS** is set to **TRUE** if the position has crossed the start position and is set to **FALSE** if the position has crossed the end position. The function block is executed cyclically. The function block has the possibility to compensate a delay time of the connected device, e.g. glue nozzles. It is also possible to define a hysteresis for switching on and off of the PLS.

5.2.13.32.2 Arguments

5.2.13.33.3.1 Input

ibExecute	Description	Enable PLS
	Data type	BOOL
iPosition	Description	Any position of a modulo axis
	Data type	LREAL
iModuloPosition	Description	Modulo position of axis
	Data type	LREAL
iStartPos	Description	Start position of PLS
	Data type	LREAL
iEndPos	Description	End position of PLS
	Data type	LREAL

iDelayTime	Description	Delay time for compensation
	Data type	TIME
iHysteresis	Description	Hysteresis
	Data type	LREAL
ibForce	Description	Force PLS
	Data type	BOOL

5.2.13.34.4.2 Output

oPLS	Description	Position limit switch
	Data type	BOOL

5.2.13.35.5 Example

5.2.13.36.6.1 Function Block Diagram

5.2.13.37.7 Timing

5.2.13.38.8 Hysteresis

5.2.13.39 FB_AxisPLsPosNoModulo

5.2.13.40.1 Description

This function block can be used for any position of a none-modulo axis in both directions. The Boolean output oPLS is set to TRUE if the position has crossed the start position and is set to FALSE if the position has crossed the end position. The function block has the possibility to compensate a delay time of the connected device, e.g. glue nozzles. It is also possible to define a hysteresis for switching on and off of the PLS.

5.2.13.41.2 Arguments

5.2.13.42.3.1 Input

ibExecute	Description	Enable PLS
	Data type	BOOL
iPosition	Description	Any position of a none-modulo axis
	Data type	LREAL
iStartPos	Description	Start position of PLS
	Data type	LREAL
iEndPos	Description	End position of PLS
	Data type	LREAL
iDelayTime	Description	Delay time for compensation
	Data type	TIME
iHysteresis	Description	Hysteresis
	Data type	LREAL
ibForce	Description	Force PLS
	Data type	BOOL

5.2.13.43.4.2 Output

oPLS	Description	Position limit switch
	Data type	BOOL

5.2.13.44.5 Example

5.2.13.45.6.1 Function Block Diagram

5.2.13.46.7 Timing

5.2.13.47.8 Hysteresis

About KOLLMORGEN

Kollmorgen is a leading provider of motion systems and components for machine builders. Through world-class knowledge in motion, industry-leading quality and deep expertise in linking and integrating standard and custom products, Kollmorgen delivers breakthrough solutions that are unmatched in performance, reliability and ease-of-use, giving machine builders an irrefutable marketplace advantage.

Join the [Kollmorgen Developer Network](#) for product support. Ask the community questions, search the knowledge base for answers, get downloads, and suggest improvements.
